Executive Summary

The proposed project includes the acquisition of a 25-acre school site and the construction and operation of an elementary school on the site. The site is located on the east side Locan Avenue, approximately 650 feet north of Shields Avenue, adjacent to the City of Fresno in Fresno County.

The elementary school would serve up to 750 students in grades TK-6. The campus would have approximately 28 classrooms, administrative offices, a multi-purpose building, hardcourt areas and athletic fields that could potentially be lighted. The school would have approximately fifty employees, including administrators, faculty, and support staff. The school would be in regular session on weekdays from late August to early June, but may host special events and classes during evenings, on weekends, and during summer recess.

The project site is within the City of Fresno's Southeast Development Area (SEDA) and will not be annexed to the City of Fresno in conjunction with the approval and construction of the school project due to the need to plan for water and sewer infrastructure prior to annexation and development occurring in SEDA. However, since the project site is adjacent to the existing Fresno City limits, it will be served by City of Fresno water and sewer facilities through the approval of an extraterritorial service agreement between the Clovis Unified School District and the City of Fresno.

The District anticipates beginning construction in 2019, and that the school will open for the 2020-21 school year.

This Initial Study concluded:

1. The Initial Study identified a number of potentially significant environmental effects of the project in the following subject areas: aesthetics, air quality, biological resources, cultural resources, noise, traffic, and tribal cultural resources. The District can avoid or reduce to an insignificant level these impacts by incorporating in the project the mitigation measures listed in the table on the following pages.
2. The project would have a less than significant impact or no impact on many of the environmental resources and conditions evaluated in the Initial Study. The Initial Study explains why there would be no impacts or the impacts would be less than significant.
3. Based on items 1 and 2, above, the District should adopt a Mitigated Negative Declaration for the project.

(This area intentionally left blank)

TABLE 1
Mitigation Measures

<p>Aesthetics: Mitigation for Potential Lighting Impacts</p> <p>AE-1. All parking area lighting shall have full cut-off type fixtures. A full cut-off type fixture is a luminaire or lighting fixture that, by design of the housing, does not allow any light dispersion or direct glare to shine above a 90-degree horizontal plane from the base of the fixture. Full cut-off type fixtures must be installed in a horizontal position as designed.</p> <p>AE-2. Athletic facilities lighting shall be designed to prevent direct glare and minimize spill over illumination on adjoining properties.</p> <p>AE-3. All external signs and lighting shall be lit from the top and shine downward except where uplighting is required for safety or security purposes. The lighting shall also be, as much as physically possible, contained to the target area.</p> <p>AE-4. Exterior building lighting for security or aesthetics shall be full cut-off or a shielded type design to minimize any upward distribution of light.</p> <p>AE-5. Non-essential lighting shall be turned off by 10:00 pm.</p>
<p>Air Quality: Mitigation Measures to Reduce Localized Pollutant Concentrations</p> <p>AQ-1. The following measures shall be implemented to reduce potential expose of sensitive receptors to localized concentrations of PM emissions at nearby land uses during project construction:</p> <ol style="list-style-type: none">a. All On-road diesel vehicles shall comply with Section 2485 of Title 13 of the California Code of Regulations. This regulation limits idling from diesel-fueled commercial motor vehicles with gross vehicular weight ratings of more than 10,000 pounds and licensed for operation on highways. It applies to California and non-California based vehicles. In general, the regulation specifies that drivers of said vehicles:<ol style="list-style-type: none">1) Shall not idle the vehicle’s primary diesel engine for greater than 5 minutes at any location, except as noted in Subsection (d) of the regulation; and,2) Shall not operate a diesel-fueled auxiliary power system to power a heater, air conditioner, or any ancillary equipment on that vehicle during sleeping or resting in a sleeper berth for greater than 5.0 minutes at any location when within 1,000 feet of a restricted area, except as noted in Subsection (d) of the regulation.b. Off-road diesel equipment shall comply with the 5 minute idling restriction identified in Section 2449(d)(2) of the California Air Resources Board’s In-Use off-Road Diesel regulation. The specific requirements and exceptions in the regulations can be reviewed at the following web sites: www.arb.ca.gov/msprog/truck-idling/2485.pdf and www.arb.ca.gov/regact/2007/ordiesl07/froal.pdf.c. Signs shall be posted at the project site construction entrance to remind drivers and operators of the state’s 5 minute idling limit.d. To the extent available, replace fossil-fueled equipment with alternatively-fueled (e.g., natural gas) or electrically-driven equivalents.e. The burning of vegetative material shall be prohibited.f. The proposed project shall comply with SJVAPCD Regulation VIII for the control of fugitive dust emissions. Regulation VIII can be obtained on the SJVAPCD’s website at website URL: https://www.valleyair.org/rules/1ruleslist.htm. At a minimum, the following measures shall be implemented:<ol style="list-style-type: none">1) All disturbed areas, including storage piles, which are not being actively utilized for construction purposes, shall be effectively stabilized of dust emissions using water,

- chemical stabilizer/suppressant, covered with a tarp or other suitable cover or vegetative ground cover.
- 2) All on-site unpaved roads and off-site unpaved access roads shall be effectively stabilized of dust emissions using water or chemical stabilizer/suppressant.
 - 3) All land clearing, grubbing, scraping, excavation, land leveling, grading, cut & fill, and demolition activities shall be effectively controlled of fugitive dust emissions utilizing application of water or by presoaking.
 - 4) When materials are transported off-site, all material shall be covered, or effectively wetted to limit visible dust emissions, and at least six inches of freeboard space from the top of the container shall be maintained.
 - 5) All operations shall limit or expeditiously remove the accumulation of mud or dirt from adjacent public streets at the end of each workday. (The use of dry rotary brushes is expressly prohibited except where preceded or accompanied by sufficient wetting to limit the visible dust emissions.) (Use of blower devices is expressly forbidden.)
 - 6) Following the addition of materials to, or the removal of materials from, the surface of outdoor storage piles, said piles shall be effectively stabilized of fugitive dust emissions utilizing sufficient water or chemical stabilizer/suppressant.
 - 7) On-road vehicle speeds on unpaved surfaces of the project site shall be limited to 15 mph.
 - 8) Sandbags or other erosion control measures shall be installed sufficient to prevent silt runoff to public roadways from sites with a slope greater than one percent.
 - 9) Excavation and grading activities shall be suspended when winds exceed 20 mph (Regardless of wind speed, an owner/operator must comply with Regulation VIII's 20 percent opacity limitation).
- g. The above measures for the control of construction-generated emissions shall be included on site grading and construction plans.

Biological Resources: Mitigation for Potential Impacts to Special Status Bird Species

BR-1: Avoidance. If feasible, any vegetation removal will take place between September 1 and February 1 to avoid impacts to nesting birds in compliance with the Migratory Bird Treaty Act. If vegetation removal must occur during the nesting season, project construction may be delayed due to actively nesting birds and their required protective buffers.

BR-2: Pre-construction Surveys

- a. If vegetation removal or ground disturbance will commence between February 1 and August 31, a qualified biologist will conduct a pre-construction survey for nesting birds within 14 days of the initiation of disturbance activities. This survey will cover:
 - 1) Potential nest sites in trees, bushes, or grass within species-specific buffers of the project area (Swainson's hawk – 0.5 mile, other raptor species such as white-tailed kite – 500 ft, non-raptor species (loggerhead shrike, magpie etc. – 250 ft).
 - 2) Survey protocol developed by the Swainson's Hawk Technical Advisory Committee (TAC) should be followed (CDFG 2000), which includes survey timing and requirements for repeated visits.
- b. Surveys for burrowing owl will occur within 14 days prior to any ground disturbance, no matter the season. This survey will cover potential burrowing owl burrows in the project area and suitable habitat within 150 m (500 ft). Evaluation of use by owls shall be in accordance with California Department of Fish and Wildlife survey guidelines (CBOC 1993, CDFG 1995, CDFG 2012). Surveys will document if burrowing owls are nesting or using habitat in or directly adjacent to the project area. Survey results will be valid only for the season (breeding (Feb 1-Aug 31) or non-breeding (Sept 1-Jan 31) during which the survey is conducted.

- c. If no active nests or burrows are detected during the pre-construction survey, then no further action is required. If an active nest or burrow is detected, then the following minimization measures will be implemented.

BR-3: Minimization/Establish Buffers

- Swainson’s hawk, white-tailed kite, loggerhead shrike, Lawrence’s goldfinch, yellow-billed magpie, Nuttall’s woodpecker, oak titmouse, and MBTA-protected species:

If any active nests are discovered (and if construction will occur during bird breeding season), the USFWS and/or CDFW will be contacted to determine protective measures required to avoid take. These measures could include fencing off an area where a nest occurs, or shifting construction work temporally or spatially away from the nesting birds. Biologists are required on site to monitor construction while protected migratory birds are nesting in the project area. If an active nest is found after the completion of the pre-construction surveys and after construction begins, all construction activities will stop until a qualified biologist has evaluated the nest and erected the appropriate buffer around the nest.

- Burrowing owl

If burrowing owls are detected within the survey area, CDFW will be consulted to determine the suitable buffer. These buffers will take into account the level of disturbance of the project activity, existing disturbance of the site (vehicle traffic, humans, pets, etc.), and time of year (nesting vs. wintering). If avoidance is not feasible, the District will work with CDFW to determine appropriate mitigation, such as passive exclusion or translocation, and associated mitigation land offset (CDFG 2012).

BR-4: If avoidance is not possible, a qualified biologist will develop appropriate mitigations that will reduce project impacts to sensitive biological resources to a less than significant level. The type and amount of mitigation will depend on the resources impacted, the extent of the impacts, and the quality of habitats to be impacted. Mitigations may include, but are not limited to: 1) Compensation for lost habitat in the form of preservation or creation of in-kind habitat protected by conservation easement; 2) Purchase of appropriate credits from an approved mitigation bank or land trust servicing the Fresno County Area; 3) Payment of in-lieu fees.

Cultural Resources: Mitigation for Potential Discovery of Subsurface Resources

CR-1: If subsurface historic or prehistoric archaeological or paleontological resources are discovered during excavation and/or construction activities, construction shall stop in the immediate vicinity of the find and a qualified cultural resources professional or paleontologist shall be consulted to determine whether the resource requires further study. If the resources are determined to be significant, mitigation measures shall be identified by the cultural resources professional or paleontologist and recommended to the District. Appropriate measures for significant resources could include avoidance or capping, incorporation of the site in green space, parks, or open space, or data recovery excavations of the finds.

CR-2: If human remains are unearthed during excavation and/or construction activities, all activity shall cease immediately. No further disturbance shall occur until the County Coroner has made the necessary findings as to origin and disposition pursuant to PRC Section 5097.98(a). If the remains are determined to be of Native American descent, the coroner shall within 24 hours notify the Native American Heritage Commission (NAHC). The NAHC shall then contact the most likely descendent of the deceased Native American, who shall then serve as the consultant on how to proceed with the remains. Pursuant to PRC Section 5097.98(b), upon the discovery of Native American remains, the District shall ensure that the immediate vicinity, according to generally accepted cultural or archaeological standards or practices, where the Native American human remains are located is not damaged or disturbed by further development activity until the District has discussed and conferred with the most likely descendants regarding their recommendations.

Noise: Mitigation for Operational and Construction Noise

N-1: The following measures shall be implemented to reduce long-term operational noise impacts:

- a. The use of on-site recreational facilities shall be limited to between the hours of 7:00 a.m. to 10:00 p.m.
- b. The use of amplified sound/PA systems for on-site recreational facilities shall be prohibited.
- c. A noise barrier shall be constructed along the northern boundary of the project site to a minimum height of 6 feet above ground level. The barrier should be constructed out of masonry block or material of similar density and usage.
- d. Noise-generating maintenance activities, such as landscape maintenance and waste collection activities, shall be limited to between the hours of 7:00 a.m. to 10:00 p.m. Waste-collection areas should be located at the furthest distance possible from adjacent residential land uses.

N-2: The following measures shall be implemented to reduce construction-generated noise levels:

- a. Construction activities (excluding activities that would result in a safety concern to the public or construction workers) shall be limited to between the hours of 7:00 a.m. and 10:00 p.m. Construction activities shall be prohibited on Sundays and legal holidays.
- b. Construction equipment shall be properly maintained and equipped with noise-reduction intake and exhaust mufflers and engine shrouds, in accordance with manufacturers' recommendations. Equipment engine shrouds shall be closed during equipment operation.
- c. When not in use, all equipment shall be turned off and shall not be allowed to idle. Provide clear signage that posts this requirement for workers at the entrances to the site.

Transportation/Traffic: Mitigation for Increased Traffic Generated by Project and Pedestrian and Bicycle Safety

T-1: The District shall contribute its proportionate fair share for traffic improvements for those facilities or portions thereof not currently funded by the responsible agencies roadway impact fee program(s), as appropriate. The District's proportionate fair share is as indicated in Table E-17-3.

T-2: The District shall participate in a pro rata basis in the provision of adequate turn lane storage capacity as indicated in Table E-17-4.

T-3: The District shall install a Class II bike lane along its Locan Avenue frontage.

T-4: To improve pedestrian safety, a HAWK pedestrian signal and a high visibility crosswalk shall be installed across Locan Avenue, preferably located on the north side of Cortland Avenue.

T-5: As part of the Project, walkways shall be constructed along the Project's frontage to Locan Avenue. Where possible, walkways shall be a minimum of six (6) feet wide and be separated from the street by a park strip or barrier curb to provide some separation between pedestrians and the paved portions of the road.

T-6: The District shall work with the City to identify funding sources (such as submitting a grant application for Active Transportation Program (ATP)) to complete the Safe Routes to School paths.

Tribal Cultural Resources: Mitigation for Potential Discovery of Subsurface Resources

TC-1: If subsurface tribal cultural resources are discovered during excavation and/or construction activities, construction shall stop in the immediate vicinity of the find and a qualified tribal cultural resources professional shall be consulted to determine whether the resources require further study. If the resources are determined to be significant, mitigation measures shall be identified by the cultural resources professional and recommended to the District. If human remains are discovered, the procedures of Mitigation Measure CR-2 shall also apply.

A. Project Background Information

1. Project Title, Lead Agency, and Lead Agency Contact Information

- Project Title: Shields-Locan Elementary School Project
- Lead Agency: Clovis Unified School District
- Contact: Kevin Peterson
Assistant Superintendent, Facility Services
Clovis Unified School District
1450 Herndon Avenue,
Clovis, CA 93611
Phone: (559) 327-9260
Email: kevinpeterson@cusd.com

2. Project Location

The site is located on the east side Locan Avenue, approximately 650 feet north of Shields Avenue, adjacent to the City of Fresno in Fresno County (see Figures 1, 2, and 3, and Table A-1).

TABLE A-1
Project Location

City	Unincorporated Fresno County adjacent to City of Fresno
County	Fresno
Zip Code	93737
Assessor's Parcel Number	310 230 24, 310 230 34
Nearest Existing Major Cross Streets	Shields and Locan Avenues
Elevation	Approximately 360 ft. AMSL

Section, Township & Range	Portion of Section 23, Township 31 South, Range 21 East., Mount Diablo Base and Meridian
Latitude/Longitude	36°46'57"N, -119°39'09"W

3. Project Description

The proposed project includes the acquisition of a 25-acre school site and the construction and operation of an elementary school on the site.

The elementary school would serve up to 750 students in grades TK-6. The campus would have approximately 28 classrooms, administrative offices, a multi-purpose building, hardcourt areas and athletic fields that could potentially be lighted. The school would have approximately fifty employees, including administrators, faculty, and support staff. The school would be in regular session on weekdays from late August to early June, but may host special events and classes during evenings, on weekends, and during summer recess.

4. Actions Required to Implement Project

The Clovis Unified School District must undertake the following actions in order to implement the project:

- Complete the California Environmental Quality Act process for the project by adopting a mitigated negative declaration for the project;
- Adopt and implement the Mitigation Monitoring and Reporting Program identified in Section F of this Initial Study;
- Approve the project;
- Complete the California Department of Education school site approval process;
- Secure approvals, permits, and agreements, as necessary, from agencies and utilities that are responsible for public facilities and improvements needed for the project;

5. Project Schedule

The District anticipates beginning construction in 2019, and that the school will open for the 2020-21 school year.

6. Project Setting

a. Existing Land Uses

The proposed school site is vacant. Nearby land uses include agricultural fields both fallow and under production, urban and rural residences, and a city water supply well. The nearest commercial and industrial developments are over a mile away.

b. Public Land Use Policy

The City of Fresno 2035 General Plan Land Use Element provides adopted land use policy within the proposed project area. Although the site is within unincorporated Fresno County, it is within the City of Fresno Sphere of Influence and is subject to City of Fresno land use designations. The site is within the Southeast Development Area (SEDA), a large area adjacent to the eastern edge of the City of Fresno that is not expected to develop in the near future due to the need to plan for water and sewer infrastructure necessary to support urban development. The SEDA boundary is at Locan Avenue. The project site is adjacent to urban development within the City to the west and north and will be provided with water and sewer service through an extraterritorial service agreement with the City of Fresno.

The project site land use designated within SEDA is Residential Urban Neighborhood. Surrounding land is designated by the City of Fresno as follows: land to the north is designated Residential Medium Low, land to the east and west is designated Residential Low, land to the south is designated Regional Mixed-Use, and land to the west is designated Residential Medium Low.

- Urban Neighborhood residential covers densities from 16 to 30 units per acre, which will require multi-family dwellings but still allows for a mix of housing types including single-family houses. This land use is intended to provide for a compact community that includes community facilities and walkable access to parkland and commercial services; it also supports efficient, frequent transit service. Urban Neighborhood is designated for targeted areas with complementary land uses adjacently located.
- The Medium Low Density residential designation is intended to provide for single family detached housing with densities of 3.5 to 6 units per acre.
- Low Density residential is intended to provide for large lot residential development allowing for 1 to 3.5 housing units per acre. The resulting land use pattern is large lot residential in nature, such as rural residential, ranchettes, or estate homes.
- The Regional Mixed-Use land use designation is intended to accommodate mixed-use development in urban-scale buildings and retail establishments that serve residents and

businesses of the region at large. Medium-scale retail, residential, office, civic and entertainment uses, and shopping malls (with large format or “big-box” retail) are allowed, as are supporting uses such as gas stations and hotels in mixed-use or single use buildings. Design standards will support a pedestrian orientation within centers and along major corridors, with parking on the side or rear in general, but automobile-oriented uses also will be accommodated on identified streets and frontages. Residential densities range between 30 and 45 units per acre with a minimum 30 percent residential uses, and the maximum FAR is 2.0.

c. Zoning

The Fresno County zoning for the project site is AE 20 Exclusive Agriculture. Land to the northwest, south, and east is also zoned AE 20. Land to the northeast is zoned by Fresno County as RR Rural Residential.

- The AE District is intended to be an exclusive district for agriculture and those uses which are necessary and an integral part of the agricultural operation. This district is intended to protect the general welfare of the agricultural community from encroachments of non-related agricultural uses which by their nature would be injurious to the physical and economic well-being of the agricultural district.
- The RR District is intended to create or preserve rural or very large lot residential homesites where a limited range of agricultural activities may be conducted.

Land to the north is zoned by the City of Fresno as RS-4, and land to the west is zoned by the City of Fresno as RS-5.

- RS-4 – Residential Single-Family, Medium Low Density
- RS-5 – Residential Single-Family, Medium Density

d. Streets and Highways

Locan and Shields Avenues are the existing streets nearest the project site. Locan Avenue is a north-south two-lane collector adjacent to the west side of the proposed project site. Shields Avenue is an east-west four-lane arterial in the vicinity of the project site. Courtland Avenue will be extended along the south side of the project site and Jewel Avenue will be extended along the east side of the project site. Access to the campus will be located along these two roads.

(Please see Section E, 17, for additional information on streets and highways.)

e. Public Utilities and Services

The project site is within the City of Fresno’s Southeast Development Area (SEDA) and will not be annexed to the City of Fresno in conjunction with the approval and construction of the school project. The area will be considered for annexation at a later date once water and sewer infrastructure planning take place at a more comprehensive scale. However, since the project site is adjacent to the existing Fresno City limits it will be served by City of Fresno water and sewer facilities through the approval of an Extraterritorial Water and Sewer Service and Offsite Infrastructure Agreement between Clovis Unified School District and the City of Fresno (Appendix 1). Existing sewer and water facilities which serve the neighborhood to the north of the project site are located nearby. The location and design of the water and sewer facilities would be subject to review and approval by the City of Fresno.

Storm water management will be provided by an on-site retention basin located on the northeast corner of Locan and Courtland Avenues, on the southwest corner of the site.

The Fresno County Sheriff’s Office will provide law enforcement services, and the Fresno County Fire Protection District will provide fire protection services for the project site until such time that it is annexed to the City of Fresno.

(Please see Sections E, 15, and 19 for additional information on Public Utilities and Services.)

7. Request for Preliminary Comment

Clovis Unified distributed a Request for Preliminary Comment for the proposed school project to responsible, trustee and other agencies that might have an interest in the project. The Request for Preliminary Comment provided an opportunity for the agencies to comment on the potential environmental effects of the project, including whether an Environmental Impact Report, Mitigated Negative Declaration, or Negative Declaration should be prepared for the project. Clovis Unified also sent the Request for Preliminary Comment to residents and property owners adjacent to the project site.

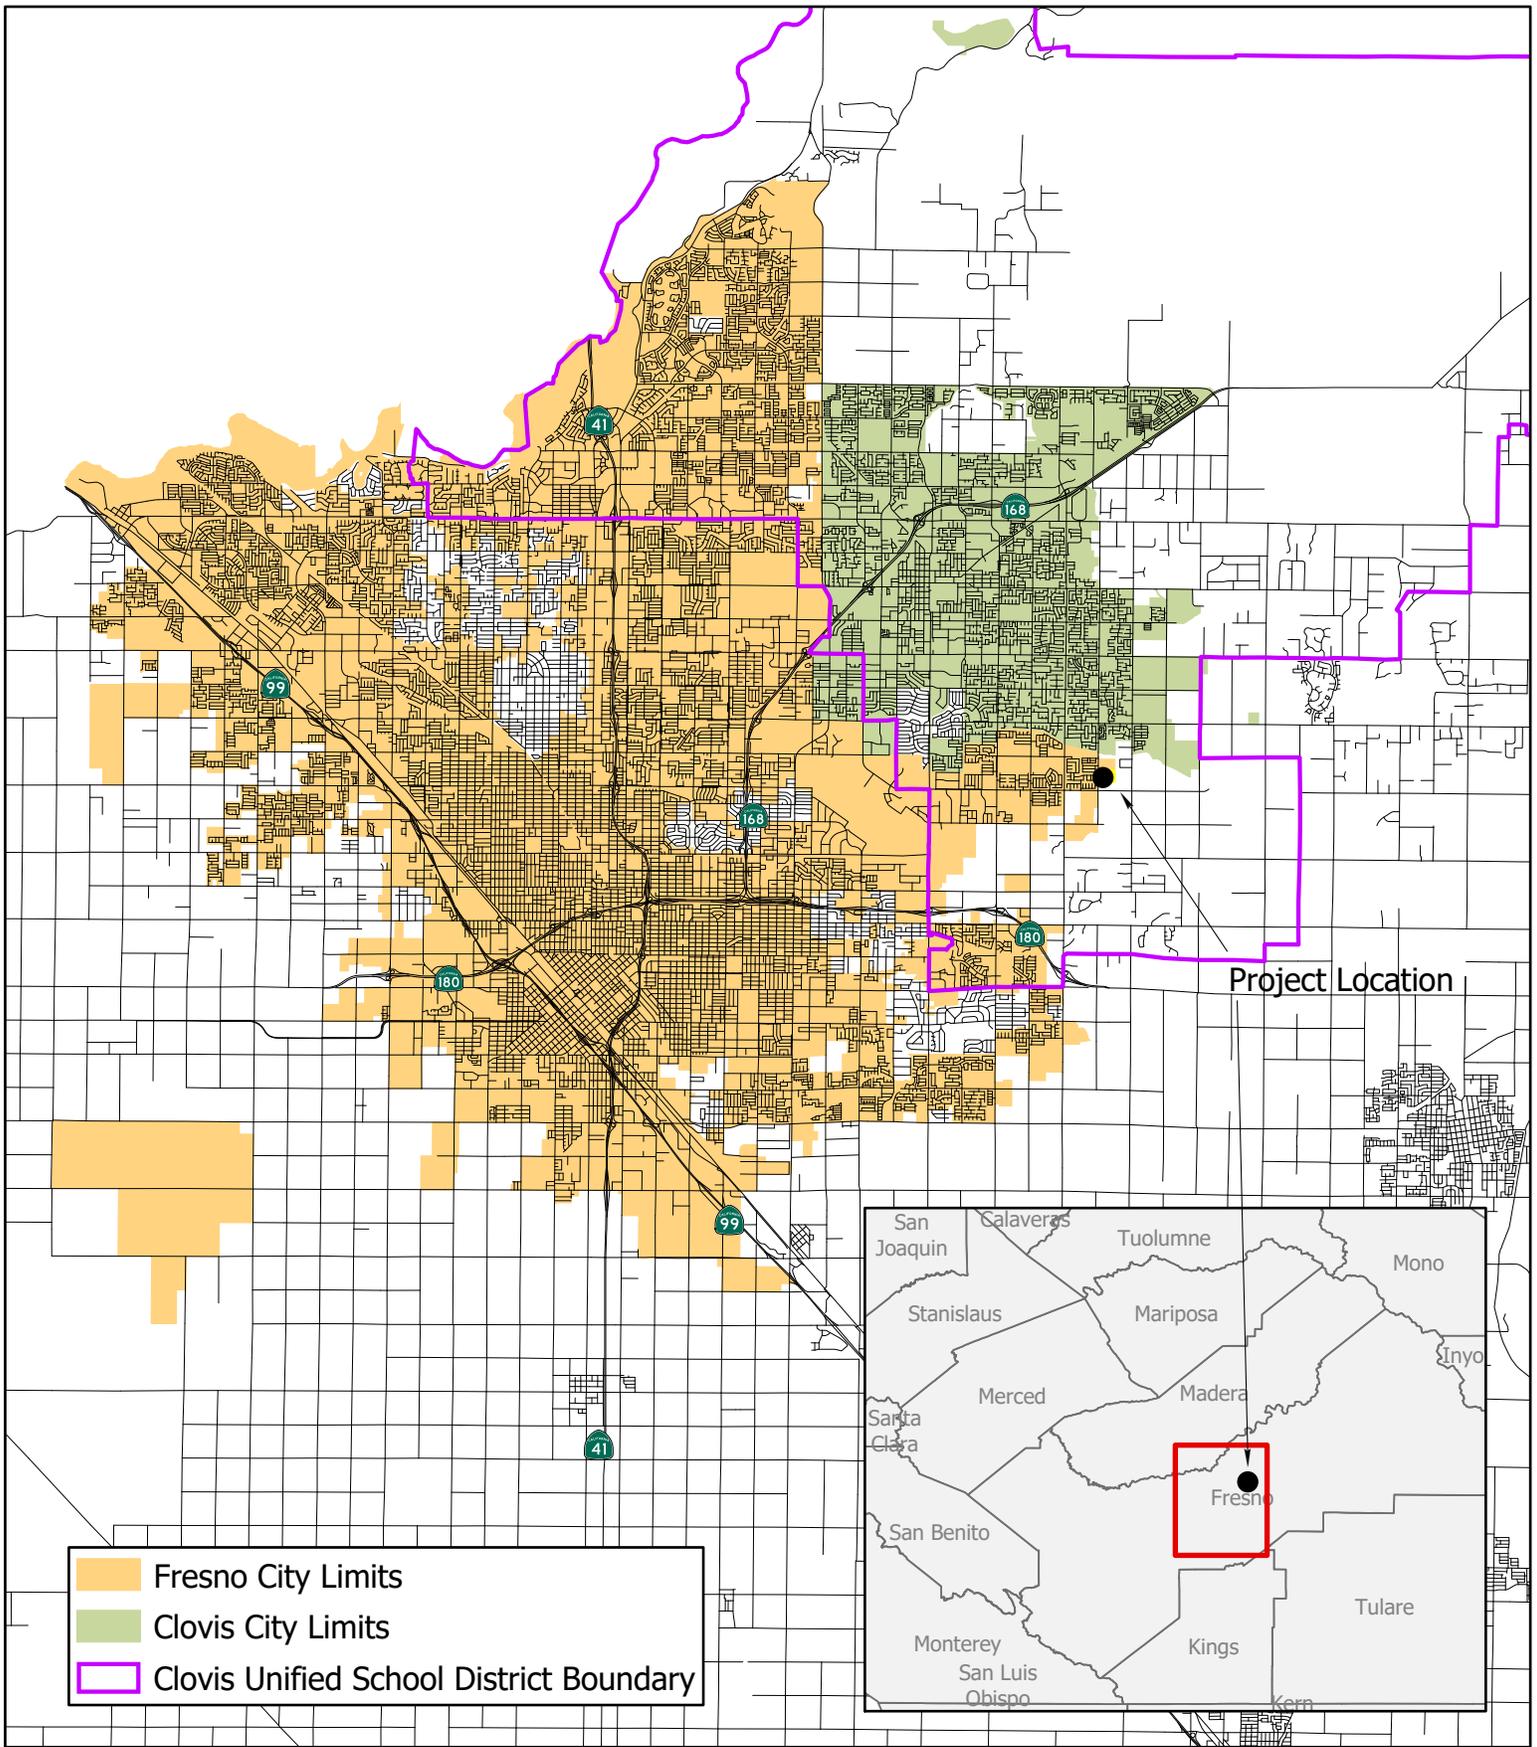

8. Other Public Agencies Whose Approval is Required

Implementation of the proposed school project would require approvals from the following public agencies in addition to Clovis Unified:

TABLE A-2
Responsible Agencies

Public Agency	Approval(s)
California Department of Education, School Facilities Planning Division	Review and approve proposed school for conformance with applicable state rules and regulations governing the siting and development of public schools
California Department of Toxic Substances Control	Responsible for ensuring that the proposed school sites are free of contamination or, if the properties were previously contaminated, that they have been cleaned up to a level that protects the students and staff who will occupy the new schools. Review and approve compliance with Education Code sections 17213.1 and 17213.2
Fresno Metropolitan Flood Control District	Review and approve the location, design, and construction of flood control improvements
Fresno County	Planning Commission: Determine if the project is consistent with the Fresno County General Plan Staff: Review and approve the location, design, and construction of street improvements
City of Fresno	Review and approve the location, design, and construction of water, sewer and street improvements

B. Environmental Factors Potentially Affected

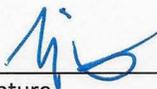

Based on the evaluations in Section E, the project would have a less than significant impact on the environmental factors listed in the following table. Those factors that require mitigation to be incorporated into the project to be less than significant are noted with an "X".

TABLE B-1
Environmental Factors Potentially Affected

X	Aesthetics		Agricultural & Forestry Resources	X	Air Quality
X	Biological Resources	X	Cultural Resources		Energy
	Geology & Soils		Greenhouse Gas Emissions		Hazards & Hazardous Materials
	Hydrology & Water Quality		Land Use & Planning		Mineral Resources
X	Noise		Population & Housing		Public Services
	Recreation	X	Transportation	X	Tribal Cultural Resources
	Utilities & Service Systems		Wildfire		Mandatory Findings of Significance

C. Determination

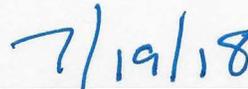

Based on this Initial Study, I find that the Shields-Locan Elementary School Project could have significant effects on the environment, but mitigation measures incorporated in the project by the Clovis Unified School District will avoid or reduce the effects to less than significant. Therefore, a Mitigated Negative Declaration will be prepared.

D. Evaluation of Environmental Impacts

1. State CEQA Guidelines Appendix G: Environmental Checklist Form

Section E in this Initial Study addresses all of the environmental issues that Appendix G in the State CEQA Guidelines suggests an Initial Study should address. In addition, it addresses several environmental issues that the California Department of Education requires be considered in the selection and approval of a school site.

The discussion of each impact in Section E concludes with a determination that the impact is potentially significant, less than significant with mitigation, less than significant, or does not involve any impact (no impact).

The “potentially significant” determination is applied if there is substantial evidence that an effect may be significant. Under the State CEQA Guidelines, a significant effect, or impact, on the environment means a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. (sec. 15382) The District must prepare an Environmental Impact Report for the project if the Initial Study identifies one or more potentially significant impacts.

The “less than significant impact with mitigation incorporated” determination applies when the incorporation by the District of mitigation measures in the project would reduce an impact from potentially significant to less than significant. This Initial Study describes each mitigation measure the District has incorporated in the project to reduce potentially significant impacts to a less than significant level.

The “less than significant” determination applies when the project would not result in a significant effect on a resource or condition. The less than significant determination is used only in cases where no mitigation measures are required to reduce an impact to a less than significant level.

The “no impact” determination applies when the project would have no impact on a resource or condition or the resource or condition does not apply to the project or its location. The no impact determination is used only in cases where no mitigation measures are required to avoid or eliminate an impact.

The discussion of impacts in this Initial Study lists each potential impact as stated in Appendix G, provides an analysis of the impact, describes each mitigation measure required to avoid the impact or reduce it to an insignificant level, and concludes with a determination of the level of significance of the impact. References to documents that would provide background information on an impact are provided where applicable.

This Initial Study incorporates by reference all documents and other sources of information cited in Sections E and H, Sources Consulted.

2. Existing Laws, Regulations, Policies, and Mitigation Measures

Introduction: In some cases, an impact that might appear significant is determined to be less than significant because it is subject to state, regional, or local laws, regulations, or policies, the application of which would reduce the impact to a less than significant level or avoid the impact entirely. In evaluating impacts, this Initial Study considered the applicable laws, regulations, and policies to determine the effect they would have on preventing or reducing potentially significant impacts. The Initial Study, however, does not cite them as mitigation measures because they would apply to the project regardless of the outcome of the Initial Study.

For the proposed project, applicable laws, regulations, and policies include but are not limited to the following:

State of California: The selection and approval of a site for a public school in California is subject to numerous state rules and regulations, most of which the California Department of Education administers to protect the health and safety of students and staff at the school. Before the Department of Education will approve a school site and the school becomes eligible for state funding, a school district must certify that “the proposed site is suitable for educational purposes and is free, or will be free prior to occupancy, from hazards that could be considered harmful to student and staff health and safety. The school district has complied with and will comply with all applicable laws and policies associated with the acquisition of the school site, including commitments for Department of Toxic Substances Control required activities...” (SFPD 4.03, 2). The state requirements include but are not limited to the following:

- *Education Code Section 17210-17224:* Specifies the environmental review process the Department of Toxic Substance Control (DTSC) administers for new school sites. DTSC ensures that proposed school sites are free of contamination or, if the properties were previously contaminated, that they have been cleaned up to a level that protects the students and staff who will occupy the new school. All proposed school sites that will receive State funding for acquisition or construction are required to go through a rigorous environmental review and cleanup process under DTSC's oversight.
- *Education Code Section 17212.5; California Code of Regulations, Title 5, Section 14010 Geological and Other Environmental Hazards Report:* District must prepare a Geological Hazards Report and other environmental hazards report as described in Appendix H of the *School Site Selection and Approval Guide, 2000 Edition*. This will include a survey of high-pressure pipelines, liquid storage tanks, railroads, airports, electrical transmission lines, and areas subject to flooding, dam inundation, seismic faulting, and liquefaction.
- *Education Code Section 17213, Public Resources Code Section 21151.8; and California Code of Regulations, Title 5, Section 14011[h],[i]; Title 14, Section 15093:* Requires District Board to adopt findings stating: (1) the proposed school site is not a current or former waste disposal site; (2) the site is not a hazardous substance release site; (3) the site does not contain pipelines; and (4) whether a qualified freeway and/or qualified traffic corridor is located within 500 feet of the site. In addition, requires board-adopted findings for hazardous air emitters and hazardous material handlers located within a 1/4 mile of the site.
- *Education Code Section 17215 and California Code of Regulations, Title 21, Division 2.5, Chapter 2.1:* airports: Requires providing a notice to the State Department of Education if a proposed school site is within two nautical miles, measured by air line, of that point on an airport runway or a potential runway included in an airport master plan that is nearest to the site. The Department of Education is required to consult with the Department of Transportation as to the safety of the site in relation to airport operations.
- *Public Resources Code Section 21151.2 and Government Code sections 53094, 65402[c]:* Require consultation with local Planning Commission to determine compatibility of proposed school site with general plan.
- *Public Resources Code Section 21151.4:* Addresses CEQA consultation requirements for the proposed construction or alteration of a facility within one-quarter mile of school that might reasonably be anticipated to emit or handling of hazardous or acutely hazardous material.
- *Title 5, California Code of Regulations, Article 2, Section 14010, Standards for School Site Selection:* The standards address: possible hazards related to power line easements, railroads, airports, major streets, above ground pipelines, underground pipelines, above ground storage tanks, traffic, noise, seismicity, geology, soils, flooding, dam flood inundation, incompatible zoning, and other safety-related factors.
- *Title 24, California Code of Regulations, Part 1 through Part 12:* Specifies the State of California building regulations for public schools. The Division of the State Architect is responsible for administering the regulations.

E. Environmental Checklist

(The questions in Sections E, 1-20 are from the State CEQA Guidelines, Appendix G: Environmental Checklist Form, Evaluation of Environmental Impacts).

1. Aesthetics

- a. **Would the project have a substantial adverse effect on a scenic vista?**

Less than Significant

The proposed project will not have a substantial adverse effect on a scenic vista. The site is flat and adjacent to urban subdivisions to the west and north and rural residences to the east and south. Distant views of the Sierra Nevada to the east and northeast are sometimes evident but frequently obscured due to poor air quality and atmospheric conditions. The Fresno General Plan and Development Code Update Master Environmental Impact Report did not identify or designate any scenic vistas within or near the project area.

- b. **Would the project substantially damage scenic resources, including, but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway?**

No Impact

There are no scenic highways within the project area. The Fresno General Plan and Development Code Update Master Environmental Impact Report and visual reconnaissance of the project site did not identify any scenic resources within or near the project area.

- c. **Would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings? If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?**

Less than Significant

The project site is located in an area transitioning from rural to urban. The areas to the north and west have been developed as urban residential. Although the project would change the visual character of the site from vacant to urban, the proposed educational facilities are common visual elements in an urban setting. Rural residents in the area may consider the change from vacant land to urban visual character an adverse impact. This change, however, is inevitable, as the City of Fresno has planned the surrounding land to the south and east for urban development, although the timing for surrounding development within the Southeast Development Area is uncertain due to the need for water and sewer infrastructure planning. Schools are typically a common and congruent visual feature within residential areas. Elementary schools designed for suburban predominantly residential neighborhoods typically have classroom and administrative buildings which are visually compatible or congruent with the surrounding community.

- d. **Would the project create a new source of light and glare that would adversely affect day or nighttime views in the area?**

Less than Significant with Mitigation

The project will increase light and glare in its vicinity. Project buildings and parking areas will be lighted in the evenings for the safety and security of the students and staff. The project would also include lighted athletic facilities. Headlights from vehicles arriving and departing the school during evening hours would be the only potential source of glare from the project. The project lighting would not be unusual within the existing and planned urban environment surrounding the site and would have no effect on agricultural operations nearby. However, to ensure that adjacent existing and future land uses are not significantly impacted, the following mitigation measures will be incorporated in the project.

- **Mitigation Measure AE-1:** All parking area lighting shall have full cut-off type fixtures. A full cut-off type fixture is a luminaire or lighting fixture that, by design of the housing, does not allow any light dispersion or direct glare to shine above a 90-degree horizontal plane from the base of the fixture. Full cut-off type fixtures must be installed in a horizontal position as designed.
- **Mitigation Measure AE-2:** Athletic facilities lighting shall be designed to prevent direct glare and minimize spill over illumination on adjoining properties.
- **Mitigation Measure AE-3:** All external signs and lighting shall be lit from the top and shine downward except where uplighting is required for safety or security purposes. The lighting shall also be, as much as physically possible, contained to the target area.
- **Mitigation Measure AE-4:** Exterior building lighting for security or aesthetics shall be full cut-off or a shielded type design to minimize any upward distribution of light.
- **Mitigation Measure AE-5:** Non-essential lighting shall be turned off by 10:00 pm.

2. Agriculture and Forestry Resources

- a. **Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non- agricultural use?**

Less than Significant

According to the Fresno County Important Farmland Map (DOC 2014), the proposed project site contains no Prime Farmland, Unique Farmland, or Farmland of Statewide Importance. The site is designated Farmland of Local Importance. Farmland of Local Importance in Fresno County refers to “All farmable lands within Fresno County that do not meet the definitions of Prime, Statewide, or Unique. This includes land that is or has been used for irrigated pasture, dryland farming, confined livestock and dairy, poultry facilities, aquaculture and grazing land.”

- b. **Would the project conflict with existing zoning for agricultural use, or a Williamson Act contract?**

Less than Significant

The proposed project site is not under Williamson Act contract (DOC 2016).

The project site is zoned by Fresno County as Exclusive Agriculture (AE-20). The AE-20 Zone is an exclusive zone for intensive agricultural uses and for those uses which are a necessary and integral part of the agricultural operation.

Although the project site is zoned for agricultural use by Fresno County, it is within the City of Fresno’s sphere of influence, contiguous to existing urban development, and is designated in the City of Fresno General Plan as Residential Multi-Family Urban Neighborhood (16-30 DU/AC). The Southeast Development Area (SEDA) is designated for urban development, and although water supply and infrastructure issues have put future development within SEDA on hold, the site would eventually be developed with urban uses whether or not the proposed project is approved.

- c. **Would the project conflict with existing zoning for, or cause rezoning of, forestland, timberland, or timberland zoned timberland production?**

No Impact

The proposed school project would have *no impact* on forestland or timberland. The site is not in an area where these resources exist.

- d. **Would the project result in the loss of forestland or conversion of forestland to non-forest use?**

This impact is addressed in Section E, 2, c.

- e. **Would the project involve other changes in the existing environment, which, due to their location or nature, could result in conversion of farmland, to non-agricultural use or conversion of forestland to non-forest use?**

Less than Significant

Aside from a small orchard adjacent to a portion of the southeast boundary of the site, there appear to be no active agricultural operations near the site. Developing school facilities adjacent to farmland could result in changes to farming practices. For example, farmers could be subject to additional restrictions on the types of herbicides and pesticides they could apply near the school property and the methods of application they could employ. Farming practices that generate dust and noise could be a nuisance to schools. However, as a practical matter, Clovis Unified and many other districts in Fresno County and the San Joaquin Valley successfully operate schools adjacent to active agricultural operations.

The owners of nearby agricultural properties were notified of the project and provided with the Request of Preliminary Comment prior to the preparation of this Initial Study. No comment was received from adjacent agricultural land owners.

3. Air Quality

This section is based on an Air Quality Analysis (Ambient 2018a) completed for the project, which is included as Appendix 2 to this Initial Study. (Table E-3-1 provides definitions for the air quality terms used in this section.)

**TABLE E-3-1
Air Quality Definitions**

Carbon Monoxide (CO)

A colorless, odorless gas resulting from the incomplete combustion of hydrocarbon fuels. CO interferes with the blood's ability to carry oxygen to the body's tissues and results in numerous adverse health effects. Over 80 percent of the CO emitted in urban areas is contributed by motor vehicles. CO is a criteria air pollutant.

Nitrogen Oxides (Oxides of Nitrogen, NOx)

A general term pertaining to compounds of nitric oxide (NO), nitrogen dioxide (NO₂) and other oxides of nitrogen. Nitrogen oxides are typically created during combustion processes and are major contributors to smog formation and acid deposition. NO₂ is a criteria air pollutant and may result in numerous adverse health effects.

Particulate Matter (PM)

Any material, except pure water, that exists in the solid or liquid state in the atmosphere. The size of particulate matter can vary from coarse, wind-blown dust particles to fine particle combustion products.

PM_{2.5}

Includes tiny particles with an aerodynamic diameter less than or equal to a nominal 2.5 microns. This fraction of particulate matter penetrates most deeply into the lungs.

PM₁₀ (Particulate Matter)

A criteria air pollutant consisting of small particles with an aerodynamic diameter less than or equal to a nominal 10 microns (about 1/7 the diameter of a single human hair). Their small size allows them to make their way to the air sacs deep within the lungs where they may be deposited and result in adverse health effects. PM₁₀ also causes visibility reduction.

Reactive Organic Gas (ROG)

A photochemically reactive chemical gas, composed of non-methane hydrocarbons, that may contribute to the formation of smog. Also, sometimes referred to as Non-Methane Organic Gases (NMOGs). (See also Volatile and Hydrocarbons.)

Sulfur Dioxide (SO₂)

A strong smelling, colorless gas that is formed by the combustion of fossil fuels. Power plants, which may use coal or oil high in sulfur content, can be major sources of SO₂ and other sulfur oxides contribute to the problem of acid deposition. SO₂ is a criteria air pollutant.

Source: California Air Resources Board. *Glossary of Air Pollution Terms* (2015)

a. Would the project conflict with or obstruct implementation of the applicable air quality plan?

Less than Significant with Mitigation

In accordance with SJVAPCD-recommended methodology for the assessment of air quality impacts, projects that result in significant air quality impacts at the project level are also considered to have a significant cumulative air quality impact. As noted in Section E, 3, b, short-term construction and long-term operational emissions would not exceed applicable thresholds. In addition, the proposed project's contribution to localized concentrations of emissions, including emissions of CO, TACs, and odors, are considered less than significant. However, as noted Section E, 3, b, the proposed project could result in a significant cumulative contribution of criteria pollutants for which the SJVAB is currently designated non-attainment. For this reason, implementation of the proposed project could conflict with air quality attainment or maintenance planning efforts. This impact would be considered potentially significant. Refer to Sections E, 3, b, and E, 3, c for additional discussion of air quality impacts.

Mitigation Measure: Implement Mitigation Measure AQ-1 (refer to Section E, 3, c)

b. Would the project violate any air quality standard or result in a cumulatively considerable net increase in an existing or projected air quality violation?

Less than Significant

Short-term Construction Emissions

Short-term increases in emissions would occur during the construction process. Construction-generated emissions are of temporary duration, lasting only as long as construction activities occur, but have the potential to result in a significant air quality impact. The construction of the proposed project would result in the temporary generation of emissions associated with site grading and excavation, paving, motor vehicle exhaust associated with construction equipment and worker trips, as well as the movement of construction equipment on unpaved surfaces. Short-term construction emissions would result in increased emissions of ozone-precursor pollutants (i.e., ROG and NO_x) and emissions of PM. Emissions of ozone-precursors would result from the operation of on-road and off-road motorized vehicles and equipment. Emissions of airborne PM are largely dependent on the amount of ground disturbance associated with site preparation activities and can result in increased concentrations of PM that can adversely affect nearby sensitive land uses. Estimated construction-generated annual emissions associated with the proposed project alternatives are summarized in Ambient 2018a, Table 5.

As noted in Ambient 2018a, Table 5, construction of the proposed project would generate maximum uncontrolled annual emissions of approximately 4.0 tons/year of ROG, 3.4 tons/year of NO_x, 2.5 tons/year of CO, 0.4 tons/year of PM₁₀, and 0.4 tons/year of PM_{2.5}. Emissions of SO₂ would be negligible (e.g., less than 0.1 tons/year). Estimated construction-generated emissions would not exceed the SJVAPCD's significance thresholds of 10 tons/year of ROG, 10 tons/year of NO_x, or 15 tons/year PM₁₀.

Estimated daily on-site construction emissions are summarized in Ambient 2018a, Table 6. As noted in the table, construction of the proposed project would generate maximum uncontrolled on-site emissions of approximately 18 lbs/day of ROG, 50 lbs/day of NO_x, 46 lbs/day of CO, 20 lbs/day of PM₁₀, and 12 lbs/day of PM_{2.5}. Emissions of SO₂ would be negligible (e.g., less than 0.1 tons/year). Daily on-site construction emissions would not exceed the SJVAPCD's recommended localized ambient air quality significance thresholds of 100 lbs/day for each of the criteria air pollutants evaluated.

Short-term construction of the proposed project would not result in a significant impact to regional or local air quality conditions. Furthermore, it is important to note that the proposed project would be required to

comply with SJVPACD Regulation VIII (Fugitive PM₁₀ Prohibitions). Mandatory compliance with SJVAPCD Regulation VIII would further reduce emissions of fugitive dust from the project site and minimize the project's potential to adversely affect nearby sensitive receptors. With compliance with SJVAPCD Regulation VIII, emissions of PM would be reduced by approximately 50 percent, or more. Given that project-generated emissions would not exceed applicable SJVAPCD significance thresholds, this impact would be considered less than significant.

Long-term Operational Emissions

Estimated annual operational emissions for the proposed project are summarized in Ambient 2018a, Table 7. As depicted, the proposed project would result in operational emissions of approximately 0.7 tons/year of ROG, 4.3 tons/year of NOX, 3.3 tons/year of CO, 0.8 tons/year of PM₁₀, and 0.3 tons/year of PM_{2.5} during the initial year of operation. Emissions of SO₂ would be negligible (i.e., less than 0.1 tons/year). Operational emissions would be projected to decline in future years, with improvements in fuel-consumption emissions standards. Operational emissions would not exceed SJVAPCD's mass-emissions significance thresholds.

Estimated average-daily on-site operational emissions are also summarized in Ambient 2018a, Table 7. As noted, average-daily on-site operational emissions would be largely associated with area sources. Emissions would be largely associated with occasional landscape maintenance activities, as well as, evaporative ROG emissions associated with the application of architectural coatings and use of consumer products. Average-daily on-site emissions of ROG would total approximately 3 lbs/day. Average-daily onsite emissions of other pollutants would be negligible (i.e., less than 0.1 lbs/day). Average-daily onsite emissions would not exceed the SJVAPCD's recommended localized ambient air quality significance thresholds of 100 lbs/day for each of the criteria air pollutants evaluated.

Long-term operation of the proposed project would not result in a significant impact to regional or local air quality conditions. It is important to note that estimated operational emissions are conservatively based on the default vehicle fleet distribution assumptions contained in the model, which include contributions from medium and heavy-duty trucks. Mobile sources associated with schools typically consist largely of light-duty vehicles and buses. As a result, actual mobile source emissions would likely be less than estimated.

c. Would the project expose sensitive receptors to substantial pollutant concentrations?

Less than Significant with Mitigation

Sensitive land uses located in the vicinity of the proposed project site consist predominantly of residential land uses. The nearest residential land uses are generally located west of the project site, across Locan Avenue. Long-term operational and short-term construction activities and emission sources that could adversely impact these nearest sensitive receptors are discussed below:

Short-term Construction

Naturally Occurring Asbestos

Naturally-occurring asbestos, which was identified by ARB as a TAC in 1986, is located in many parts of California and is commonly associated with ultramafic rock. The project site is not located near any areas that are likely to contain ultramafic rock (DOC 2000). As a result, risk of exposure to asbestos during the construction process would be considered less than significant.

Diesel-Exhaust Emissions

Implementation of the proposed project would result in the generation of DPM emissions during construction associated with the use of off-road diesel equipment for site grading and excavation, paving and other construction activities. Health-related risks associated with diesel-exhaust emissions are primarily associated with long-term exposure and associated risk of contracting cancer. For residential land uses, the calculation of cancer risk associated with exposure of to TACs are typically calculated based on a 25 to 30-year period of exposure. The use of diesel-powered construction equipment, however, would be temporary and episodic and would occur over a relatively large area. Assuming that construction activities involving the use of diesel-fueled equipment would occur over an approximate 18-month period, project-related construction activities would constitute less than six percent of the typical exposure period. As a

result, exposure to construction-generated DPM would not be anticipated to exceed applicable thresholds (i.e., incremental increase in cancer risk of 20 in one million). In addition, implementation of Mitigation Measure AQ-1 would result in further reductions of onsite DPM emissions. For these reasons, this impact would be considered less than significant.

Localized PM Concentrations

Construction of the proposed project may result in the generation of fugitive dust. Fugitive dust emissions would be primarily associated with earth-moving, material handling and demolition activities, as well as, vehicle travel on unpaved and paved surfaces. Onsite off-road equipment and trucks would also result in short-term emissions of diesel-exhaust PM. Fugitive dust can also be generated during the clearing of vegetation, including the burning of vegetative material. Uncontrolled emissions of fugitive dust may contribute to increased occurrences of Valley Fever and may also result in increased nuisance impacts to nearby land uses and receptors. As a result, localized uncontrolled concentrations of construction-generated PM would be considered to have a potentially-significant impact.

Long-term Operation

Localized Mobile-Source CO Emissions

Carbon monoxide is the primary criteria air pollutant of local concern associated with the proposed project. Under specific meteorological and operational conditions, such as near areas of heavily congested vehicle traffic, CO concentrations may reach unhealthy levels. If inhaled, CO can be adsorbed easily by the blood stream and can inhibit oxygen delivery to the body, which can cause significant health effects ranging from slight headaches to death. The most serious effects are felt by individuals susceptible to oxygen deficiencies, including people with anemia and those suffering from chronic lung or heart disease.

Mobile-source emissions of CO are a direct function of traffic volume, speed, and delay. Transport of CO is extremely limited because it disperses rapidly with distance from the source under normal meteorological conditions. For this reason, modeling of mobile-source CO concentrations is typically recommended for sensitive land uses located near signalized roadway intersections that are projected to operate at unacceptable levels of service (i.e., LOS E or F). Localized CO concentrations associated with the proposed project would be considered less-than-significant impact if: (1) traffic generated by the proposed project would not result in deterioration of a signalized intersection to a level of service (LOS) of E or F; or (2) the project would not contribute additional traffic to a signalized intersection that already operates at LOS of E or F.

Signalized intersections in the project area include the Locan Avenue/Ashlan Avenue and the Temperance Avenue/Shields Avenue intersections. With implementation of the proposed traffic improvements, these intersections are projected to operate at LOS D, or better, for existing-plus-project, near-term, and future cumulative conditions (JLB 2018). In comparison to the CO screening criteria, implementation of the proposed project would not result in or contribute to unacceptable levels of service (i.e., LOS E, or worse) at nearby signalized intersections. As a result, the proposed project would not be anticipated to contribute substantially to localized CO concentrations that would exceed applicable standards. For this reason, this impact would be considered less than significant.

Toxic Air Contaminants

No major stationary sources of TACs or major agricultural operations are located within one-quarter mile of the project site (SJVAPCD 2018). In addition, the project site is not located within 500 feet of a freeway or other busy traffic corridor. Predicted onsite health risks for onsite student and staff are anticipated to be minor and would not be anticipated to exceed the SJVAPCD's significance thresholds. In addition, implementation of the proposed project would not result in the long-term operation of any major onsite stationary sources of TACs, nor would project implementation result in a significant increase in diesel-fueled vehicles traveling along area roadways. For these reasons, long-term exposure to TACs would be considered less than significant.

The following measures shall be implemented to reduce potential exposure of sensitive receptors to localized concentrations of PM emissions at nearby land uses during project construction:

Mitigation Measure AQ-1. The following measures shall be implemented to reduce potential exposure of sensitive receptors to localized concentrations of PM emissions at nearby land uses during project construction:

- a. On-road diesel vehicles shall comply with Section 2485 of Title 13 of the California Code of Regulations. This regulation limits idling from diesel-fueled commercial motor vehicles with gross vehicular weight ratings of more than 10,000 pounds and licensed for operation on highways. It applies to California and non-California based vehicles. In general, the regulation specifies that drivers of said vehicles:
 - 1) Shall not idle the vehicle's primary diesel engine for greater than 5 minutes at any location, except as noted in Subsection (d) of the regulation; and,
 - 2) Shall not operate a diesel-fueled auxiliary power system to power a heater, air conditioner, or any ancillary equipment on that vehicle during sleeping or resting in a sleeper berth for greater than 5.0 minutes at any location when within 1,000 feet of a restricted area, except as noted in Subsection (d) of the regulation.
- b. Off-road diesel equipment shall comply with the 5 minute idling restriction identified in Section 2449(d)(2) of the California Air Resources Board's In-Use off-Road Diesel regulation. The specific requirements and exceptions in the regulations can be reviewed at the following web sites: www.arb.ca.gov/msprog/truck-idling/2485.pdf and www.arb.ca.gov/regact/2007/ordiesl07/froal.pdf.
- c. Signs shall be posted at the project site construction entrance to remind drivers and operators of the state's 5 minute idling limit.
- d. To the extent available, replace fossil-fueled equipment with alternatively-fueled (e.g., natural gas) or electrically-driven equivalents.
- e. Construction truck trips shall be scheduled, to the extent feasible, to occur during non-peak hours.
- f. The burning of vegetative material shall be prohibited.
- g. The proposed project shall comply with SJVAPCD Regulation VIII for the control of fugitive dust emissions. Regulation VIII can be obtained on the SJVAPCD's website at website URL: <https://www.valleyair.org/rules/1ruleslist.htm>. At a minimum, the following measures shall be implemented:
 - 1) All disturbed areas, including storage piles, which are not being actively utilized for construction purposes, shall be effectively stabilized of dust emissions using water, chemical stabilizer/suppressant, covered with a tarp or other suitable cover or vegetative ground cover.
 - 2) All on-site unpaved roads and off-site unpaved access roads shall be effectively stabilized of dust emissions using water or chemical stabilizer/suppressant.
 - 3) All land clearing, grubbing, scraping, excavation, land leveling, grading, cut & fill, and demolition activities shall be effectively controlled of fugitive dust emissions utilizing application of water or by presoaking.
 - 4) When materials are transported off-site, all material shall be covered, or effectively wetted to limit visible dust emissions, and at least six inches of freeboard space from the top of the container shall be maintained.
 - 5) All operations shall limit or expeditiously remove the accumulation of mud or dirt from adjacent public streets at the end of each workday. (The use of dry rotary brushes is expressly prohibited except where preceded or accompanied by sufficient wetting to limit the visible dust emissions.) (Use of blower devices is expressly forbidden.)
 - 6) Following the addition of materials to, or the removal of materials from, the surface of outdoor storage piles, said piles shall be effectively stabilized of fugitive dust emissions utilizing sufficient water or chemical stabilizer/suppressant.
 - 7) On-road vehicle speeds on unpaved surfaces of the project site shall be limited to 15 mph.

- 8) Sandbags or other erosion control measures shall be installed sufficient to prevent silt runoff to public roadways from sites with a slope greater than one percent.
- 9) Excavation and grading activities shall be suspended when winds exceed 20 mph (Regardless of wind speed, an owner/operator must comply with Regulation VIII's 20 percent opacity limitation).
- h. The above measures for the control of construction-generated emissions shall be included on site grading and construction plans.

d. Would the project result in objectionable odors affecting a substantial number of people?

Less than Significant

The occurrence and severity of odor impacts depends on numerous factors, including: the nature, frequency, and intensity of the source; wind speed and direction; and the sensitivity of the receptors. While offensive odors rarely cause any physical harm, they still can be very unpleasant, leading to considerable distress among the public and often generating citizen complaints to local governments and regulatory agencies.

No major sources of odors have been identified in the project area. However, construction of the proposed project would involve the use of a variety of gasoline or diesel-powered equipment that would emit exhaust fumes. Exhaust fumes, particularly diesel-exhaust, may be considered objectionable by some people. In addition, pavement coatings and architectural coatings used during project construction would also emit temporary odors. However, construction-generated emissions would occur intermittently throughout the workday and would dissipate rapidly within increasing distance from the source. As a result, short-term construction activities would not expose a substantial number of people to frequent odorous emissions.

4. Biological Resources

A Biological Resources Assessment (Odell 2018) was prepared for this project and is included as Appendix 3 to this Initial Study. This Initial Study uses information from the analysis to evaluate the proposed school project.

a. Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U. S. Fish and Wildlife Service?

Less than Significant with Mitigation

The project site consisted of fallow or ruderal agricultural land (ruderal/fallow land), in the form of a frequently disked field with grasses and forbs. As such, the project site has been disturbed from its natural state for many years. Although loss of fallow agricultural land may result in decreased foraging area for some species, such land is of limited habitat value for sensitive plant and wildlife species, especially due to the amount of disturbance from humans, vehicles, and domestic animals on a regular basis. The direct impacts of the proposed school will be a loss of marginal habitat and possible direct mortality for any animals in the path of construction equipment. Direct mortality could occur to common fossorial or slow-moving mammals and reptiles within the project area. Direct take could also occur for bird eggs and nestlings within the project area if vegetation removal or ground disturbance occur during the nesting season, generally February 1 through August 31. In addition to Migratory Bird Treaty Act (MBTA)-covered bird species, other special status bird species that could occur in the vicinity include Swainson's hawk (*Buteo swainsoni*), white-tailed kite (*Elanus leucurus*), loggerhead shrike (*Lanius ludovicianus*), Lawrence's goldfinch (*Spinus lawrencei*), yellow-billed magpie (*Pica nuttalli*), Nuttall's woodpecker (*Picoides nuttallii*) (observed), oak titmouse (*Baeolophus inornatus*), and burrowing owl (*Athene cunicularia*) (Odell 2018, Appendix A). The project is not expected to result in direct take of any special status plant species (Odell 2018, Appendix B). Indirect impacts to species that may still use the area after construction could include decreased dispersal, increased mortality and injury, and increased debris that through ingestion or physical contact can be harmful to wildlife. All of these impacts are caused by the increase in human disturbance

(vehicles, people, and pets). However, impacts to special status species can be minimized to a less than significant impact with the incorporation of avoidance and minimization measures.

Special Status Species Impacts and Avoidance Measures

Database queries indicated 50 animals and 15 plant species with special status occur or have historically occurred within the 9-quad search area (Odell 2018, Appendices A and B). Many of the species from the generated list either were historic, extirpated occurrences, or were species with very specialized habitat requirements that were not present on the site or within the vicinity. Therefore, the majority of the species were “ruled out”. Based on the habitat types present within the study area, 8 special status wildlife species have the potential to occur on the site.

Special Status Birds

Eight special status avian species (Swainson’s hawk, white-tailed kite, loggerhead shrike, Lawrence’s goldfinch, yellow-billed magpie, Nuttall’s woodpecker, oak titmouse, and burrowing owl) have the potential to nest and/or forage within the study area. Greater detail regarding life history requirements of these birds is provided in Odell 2018, Appendix A. Swainson’s hawk, white-tailed kite, Lawrence’s goldfinch, yellow-billed magpie, Nuttall’s woodpecker, and oak titmouse could nest in the large trees within and adjacent to the study area. Loggerhead shrike could nest in shrubs or trees within and adjacent to the study area and forage in the open fields. Although none were detected during reconnaissance survey, burrowing owls could move into the area prior to construction, and occupy any large burrows during the nesting and wintering seasons.

Impact

Since California Department of Fish and Wildlife (CDFW) usually requires a various sized “no disturbance” buffers around nesting sites for these species, construction-related disturbance could be considered take under California Endangered Species Act (CESA) and MBTA. Specific impacts to burrowing owl according to the Staff Report on Burrowing Owl Mitigation (CDFG 1995) include any “disturbance within 50 meters (approx. 160 ft) [75 m (250 ft) during breeding season] which may result in harassment of owls at occupied burrows; destruction of natural and artificial burrows (culverts, concrete slabs and debris piles that provide shelter to burrowing owls); and destruction and/or degradation of foraging habitat adjacent (within 100 m) of an occupied burrow(s)”.

In addition, other migratory birds will likely be nesting in the study area and vicinity, most of which are protected by the Migratory Bird Treaty Act (USCA 1918). Both construction related disturbance and the removal of vegetation within the project area could result in nest abandonment or direct mortality of eggs, chicks, and/or fledglings. This type of impact to migratory birds, including special status bird species, would be considered take under the MBTA and CESA, and therefore, is a potentially significant impact. In order to avoid impacts to avian species, nests and nesting habitat should not be disturbed or destroyed. The following measures will reduce potential impacts to a less than significant level.

Special Status Plants

Of the 15 potentially occurring special status plant species, none were found within the project area. Although the site survey was not conducted at the peak blooming period for some potentially occurring special status plants, all plants could be ruled out because their elevation range, required habitat, and/or soil type differed from the site conditions. Therefore, the project will not impact any special status plant species.

Mitigation Measure BR-1 through BR-4: Mitigation for Potential Impacts to Special Status Bird Species

BR-1: Avoidance. If feasible, any vegetation removal will take place between September 1 and February 1 to avoid impacts to nesting birds in compliance with the Migratory Bird Treaty Act. If vegetation removal must occur during the nesting season, project construction may be delayed due to actively nesting birds and their required protective buffers.

BR-2: Pre-construction Surveys

- 1) If vegetation removal or ground disturbance will commence between February 1 and August 31, a qualified biologist will conduct a pre-construction survey for nesting birds within 14 days of the initiation of disturbance activities. This survey will cover:
 - i. Potential nest sites in trees, bushes, or grass within species-specific buffers of the project area (Swainson’s hawk – 0.5 mile, other raptor species such as white-tailed kite – 500 ft, non-raptor species (loggerhead shrike, magpie etc. – 250 ft).
 - ii. Survey protocol developed by the Swainson’s Hawk Technical Advisory Committee (TAC) should be followed (CDFG 2000), which includes survey timing and requirements for repeated visits.
- 2) Surveys for burrowing owl will occur within 14 days prior to any ground disturbance, no matter the season. This survey will cover potential burrowing owl burrows in the project area and suitable habitat within 150 m (500 ft). Evaluation of use by owls shall be in accordance with California Department of Fish and Wildlife survey guidelines (CBOC 1993, CDFG 1995, CDFG 2012). Surveys will document if burrowing owls are nesting or using habitat in or directly adjacent to the project area. Survey results will be valid only for the season (breeding (Feb 1-Aug 31) or non-breeding (Sept 1-Jan 31) during which the survey is conducted.
- 3) If no active nests or burrows are detected during the pre-construction survey, then no further action is required. If an active nest or burrow is detected, then the following minimization measures will be implemented.

BR-3: Minimization/Establish Buffers

- a. Swainson’s hawk, white-tailed kite, loggerhead shrike, Lawrence’s goldfinch, yellow-billed magpie, Nuttall’s woodpecker, oak titmouse, and MBTA-protected species:

If any active nests are discovered (and if construction will occur during bird breeding season), the USFWS and/or CDFW will be contacted to determine protective measures required to avoid take. These measures could include fencing off an area where a nest occurs, or shifting construction work temporally or spatially away from the nesting birds. Biologists are required on site to monitor construction while protected migratory birds are nesting in the project area. If an active nest is found after the completion of the pre-construction surveys and after construction begins, all construction activities will stop until a qualified biologist has evaluated the nest and erected the appropriate buffer around the nest.
- b. Burrowing owl

If burrowing owls are detected within the survey area, CDFW will be consulted to determine the suitable buffer. These buffers will take into account the level of disturbance of the project activity, existing disturbance of the site (vehicle traffic, humans, pets, etc.), and time of year (nesting vs. wintering). If avoidance is not feasible, the District will work with CDFW to determine appropriate mitigation, such as passive exclusion or translocation, and associated mitigation land offset (CDFG 2012).

BR-4: If avoidance is not possible, a qualified biologist will develop appropriate mitigations that will reduce project impacts to sensitive biological resources to a less than significant level. The type and amount of mitigation will depend on the resources impacted, the extent of the impacts, and the quality of habitats to be impacted. Mitigations may include, but are not limited to: 1) Compensation for lost habitat in the form of preservation or creation of in-kind habitat protected by conservation easement; 2) Purchase of appropriate credits from an approved mitigation bank or land trust servicing the Fresno County Area; 3) Payment of in-lieu fees.

- b. **Would the project have a substantially adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by the California Department of Fish and Game or U. S. Wildlife Service?**

No Impact

There are no riparian or sensitive natural communities within the project area.

- c. **Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?**

No Impact

There are no federally protected wetlands within the project area. Implementation of typical ground disturbance and erosion control Best Management Practices (BMPs) and compliance with grading permits will insure that there is no impact to storm drainage facilities or nearby canals.

- d. **Would the project interfere substantially with the movement of any resident or migratory fish or wildlife species or with established native resident migratory wildlife corridors, or impede the use of native wildlife nursery sites?**

Less than Significant

The site does not appear to constitute a “movement corridor” for native wildlife (USFWS 1998) that would attract wildlife to move through the site any more than the surrounding developed and agricultural lands. The project site is bordered by residential development, and busy streets, which restricts access for wildlife. Smaller wildlife species and birds are not expected to be further inhibited by the project as compared with residential and agricultural uses. Therefore, the project will have a less than significant effect on regional wildlife movements (MO).

- e. **Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?**

No Impact

The project appears to be consistent with relevant biological resources policies of the City of Fresno and would not conflict with local policies or ordinances protecting biological resources (City of Fresno 2014).

- f. **Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Conservation Community Plan, or other approved local, regional, or state habitat conservation plan?**

No Impact

Fresno County is not part of any HCP or NCCP, so the project would not conflict any provisions of any local, regional or state habitat conservation plan (MO, USFWS 1998, 2005).

5. Cultural Resources

A Cultural Resources Records Survey (Sierra 2018) was conducted by Sierra Valley Cultural Planning and is included as Appendix 4 to this Initial Study. This Initial Study uses information from the survey to evaluate the proposed school project.

Would the project:

- a. **Cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines §15064.5?**
b. **Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines §15064.5?**
c. **Would the project disturb any human remains, including those interred outside of dedicated cemeteries?**

Less than Significant with Mitigation

Prior to field inspection, an in-house records search was completed at the Southern San Joaquin Valley Information Center (SSJV) of the California Historical Resources Information System to identify areas

previously investigated and to identify known cultural resources present within or in close proximity to the Project Area of Potential Effect (APE). According to the Information Center records, there are no prehistoric or historic-period sites or structures identified within the project APE, and no prehistoric are identified within a ½-mile radius of the study area. One historic-period resource, the Gould Canal, is located ¼-mile north of the project site. There have been no previous investigations within the APE; seven investigations have occurred within a ½-mile radius of the parcel. No cultural resource sites listed on the National Register of Historic Places, the California Register of Historic Resources, California Points of Historical Interest, State Historic Landmarks, or the California Inventory of Historic Resources have been documented either in or within ¼-mile radius of the project APE.

No archaeological or other cultural resources were identified as a result of this study. Therefore, it is unlikely that the proposed action will have an effect on important archaeological, historical, or other cultural resources. No further cultural resources investigation is therefore recommended.

In the unlikely event that subsurface historical, archaeological or paleontological resources are discovered during construction, the following mitigation measures will be incorporated into the project.

- **Mitigation Measure CR-1:** If subsurface historic or prehistoric archaeological or paleontological resources are discovered during excavation and/or construction activities, construction shall stop in the immediate vicinity of the find and a qualified cultural resources professional or paleontologist shall be consulted to determine whether the resource requires further study. If the resources are determined to be significant, mitigation measures shall be identified by the cultural resources professional or paleontologist and recommended to the District. Appropriate measures for significant resources could include avoidance or capping, incorporation of the site in green space, parks, or open space, or data recovery excavations of the finds.
- **Mitigation Measure CR-2:** If human remains are unearthed during excavation and/or construction activities, all activity shall cease immediately. No further disturbance shall occur until the County Coroner has made the necessary findings as to origin and disposition pursuant to PRC Section 5097.98(a). If the remains are determined to be of Native American descent, the coroner shall within 24 hours notify the Native American Heritage Commission (NAHC). The NAHC shall then contact the most likely descendent of the deceased Native American, who shall then serve as the consultant on how to proceed with the remains. Pursuant to PRC Section 5097.98(b), upon the discovery of Native American remains, the District shall ensure that the immediate vicinity, according to generally accepted cultural or archaeological standards or practices, where the Native American human remains are located is not damaged or disturbed by further development activity until the District has discussed and conferred with the most likely descendants regarding their recommendations.

6. Energy Resources

Would the project:

- Result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy, or wasteful use of energy resources, during project construction or operation?**
- Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?**

Less than Significant

The plans for all public school projects in California must be submitted to the Division of the State Architect (DSA) for plan review and must comply with DSA and California Energy Commission (CEC) Energy Efficiency Standards. These requirements ensure that schools, including the proposed project by Clovis Unified, would not result in the inefficient, wasteful, or unnecessary consumption of energy. The project does not conflict with any Fresno General Plan policies related to renewable energy or energy efficiency.

7. Geology and Soils

The District retained AECOM to prepare a Geological/Environmental Hazards Report (AECOM 2018) for the proposed school site which is included as Appendix 4 to this Initial Study. The report was prepared following the requirements of California Education Code section 17212. This Initial Study uses information from the study to evaluate the proposed school project.

- a. **Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:**
- **Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.**
 - **Strong seismic ground shaking?**
 - **Seismic-related ground failure, including liquefaction?**
 - **Landslides?**
 - **Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project and potentially result in on or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?**
 - **Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?**

Less than Significant

The conclusions and recommendations of the AECOM study for geologic and soils conditions are as follows:

- The Project Site is not located within the boundaries of an Alquist-Priolo Earthquake Fault Zone, and no active faults are known to traverse the Project Site;
- Ground shaking caused by events on distant and nearby active faults is considered a possible seismic hazard at the Project Site; however, this would be true for any potential school site within the school district boundaries;
- Based on the moderate ground shaking potential at the site, liquefaction is unlikely;
- The existing topography at the site does not provide sufficient relief to cause concern due to potential landslides. There are no topographic features of significant relief that could present a landslide hazard to the facility within several miles of the site.
- The site is located in an area with little or no subsidence;
- Based on the soil type mapped at the site, the risk of seismic settlement is considered negligible;
- The site is not located within an area of soils known to have moderately high-to-high expansion potential. Furthermore, the soil type mapped at the site does not appear likely to present an expansive soil hazard. Therefore, the risk of expansive soils at the site is considered negligible to low;

As a standard part of the school project design process, the District would retain a qualified consultant to prepare the design level Geotechnical Investigation Report. The design parameters identified in the analyses would be subject to review and approval by California Division of the State Architect, and the District would incorporate approved standards in the project design.

- b. **Would the project result in substantial soil erosion or the loss of topsoil?**

The potential for water- or wind-borne erosion and loss of topsoil would exist during the construction phase of the proposed project, primarily due to clearing, grubbing, and grading activities. Once construction is completed, the potential for erosion would be minimal because the ground would be covered by buildings, hard surfaces, and landscaping.

Less than Significant

The project would be subject to requirements of the Central Valley Regional Water Quality Control Board and the San Joaquin Valley Air Pollution Control District. General Construction Permit, Order No. R5-2016-0040, issued by the State Water Quality Control Board in 2016, regulates construction projects of one acre or more, including the proposed project. Projects obtain coverage under the permit by developing and implementing the Storm Water Pollution Prevention Plans, which must specify best management practices that a project would employ to minimize pollution of storm water. Best management practices include erosion controls, sediment controls, wind erosion controls, non-storm water management controls, and waste management and controls (i.e. good housekeeping practices).

The intent of San Joaquin Valley Air Pollution Control District Regulation VIII (Fugitive PM10 Prohibitions) is to reduce ambient concentrations of fine particulate matter (PM10) by requiring actions to prevent, reduce or mitigate anthropogenic fugitive dust emissions. The regulation includes specific measures for construction projects.

- c. **Would the project have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?**

No Impact

The project would connect to the City of Fresno sewer system. It would not involve the use of septic tanks or alternative wastewater disposal systems.

- c. **Would the project directly or indirectly destroy a unique paleontological resources or site or unique geological feature?**

Less than Significant

There are no known unique paleontological resources or unique geological features on or near the site. See Sections E, 1, a-b, and E, 5, b.

8. Greenhouse Gas Emissions

A technical analysis of greenhouse gas emissions (Ambient 2018a) was conducted for the project and is included as Appendix 2 to this Initial Study. This Initial Study uses information from the analysis to evaluate the proposed school project.

- a. **Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?**

Less than Significant

Implementation of the proposed project would contribute to increases of GHG emissions that are associated with global climate change. Short-term and long-term GHG emissions associated with the development of the proposed project are discussed in greater detail, as follows:

Short-term Greenhouse Gas Emissions

Short-term annual GHG emissions are summarized in Ambient 2018a, Table 10. Based on the modeling conducted, annual emissions of GHGs associated with construction of the proposed project would total approximately 496.5 MTCO_{2e}. There would also be a small amount of GHG emissions from waste generated during construction; however, this amount is speculative. Actual emissions would vary, depending on various factors including construction schedules, equipment required, and activities conducted. Assuming an average project life of 30 years, amortized construction-generated GHG emissions would total approximately 16.6 MTCO_{2e}/yr. Amortized construction-generated GHG emissions were included in the operational GHG emissions inventory for the evaluation of project-generated GHG emissions (refer to Ambient 2018a, Table 11).

Long-term Greenhouse Gas Emissions

Estimated long-term increases in GHG emissions associated with the proposed project are summarized in Ambient 2018a, Table 11. Based on the modeling conducted, operational GHG emissions would total approximately 1,651.3 MTCO₂e/year in 2020 and approximately 1,381.1 MTCO₂e/year in 2030. With the inclusion of amortized construction emissions, operational GHG emissions would total approximately 1,667.9 MTCO₂e/year in 2020 and approximately 1,397.7 MTCO₂e/year in 2030. Based on this estimate and assuming a population of 750 students and 50 employees, the calculated GHG efficiency for the proposed project would be 2.1 MTCO₂e/SP/yr in 2020 and 1.8 MTCO₂e/SP/yr in 2030. The GHG efficiency for the proposed project would not exceed the thresholds of 4.9 MTCO₂e/SP/yr in 2020 or 2.6 MTCO₂e/SP/yr in 2030.

As depicted in Ambient 2018a, Table 11, operational GHG emissions associated with the proposed project would be predominantly associated with mobile sources. With the implementation of a Safe Routes to School (SRTS) program, mobile-source emissions would be reduced by approximately 6.5 percent, which would result in additional reductions in overall operational GHG emissions (SRTSNP 2015). With implementation of a SRTS program, the calculated GHG efficiency for the proposed project would be 2.0 MTCO₂e/SP/yr in 2020 and 1.7 MTCO₂e/SP/yr in 2030.

It is also important to note that mobile-source emissions were conservatively calculated, based on the default fleet distribution assumptions contained in the model, which includes medium and heavy-duty vehicles. Mobile sources associated with schools typically consist largely to light-duty vehicles and buses. As a result, actual mobile-source emissions would be less. The GHG efficiency for the proposed project would not exceed the efficiency thresholds of 4.9 MTCO₂e/SP/yr in 2020 or 2.6 MTCO₂e/SP/yr in 2030.

- b. Would the project conflict with any applicable plan, policy, or regulation of an agency adopted to reduce the emissions of greenhouse gases?**

Less than Significant

As noted in Ambient 2018a, the proposed project would not result in increased GHG emissions that would conflict with AB 32 GHG-reduction targets. The proposed project would be designed to meet current building energy-efficiency standards, which includes measures to reduce overall energy use, water use, and waste generation. The project would also be designed to promote the use of alternative means of transportation, such as bicycle use, and to provide improved pedestrian access that would link the project site to nearby land uses. These improvements would help to further reduce the project's GHG emissions and would also help to reduce community-wide GHG emissions. For these reasons, the proposed project would not conflict with local or state GHG-reduction planning efforts.

9. Hazards and Hazardous Materials

- a. Would the project:**

- **Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?**
- **Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?**

Less than Significant

Construction of the project would involve the transport and use of fuels, lubricants, greases, solvents, and architectural coatings including paints.

Operation of the project would involve hazardous materials used for cleaning and maintenance purposes: cleansers, solvents, paints, pesticides, and fertilizers.

The school would be subject to state and local regulations governing the routine transport, use, and disposal of hazardous materials and the release of hazardous materials into the environment.

In addition, the California Education Code requires that the proposed school site undergo an environmental review process overseen by the California Department of Toxic Substances Control (DTSC). The purpose of the process is to determine if a release or threatened release of any hazardous materials found on the proposed site or presence of any naturally occurring hazardous materials on the site present a risk to human health or the environment. The District, working with DTSC, must identify and implement measures that would mitigate any hazardous conditions before the California Department of Education would approve the school site and provide funding for the project. (Education Code sections 17213.1, and 17213.2)

- b. Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?**

Less than Significant

The proposed project involves the construction and operation of a school and athletic facilities; no other existing or proposed schools are within one-quarter mile of the project. The potential for the project to emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste is addressed in Section E, 8, a, and was determined to be *less than significant*.

- c. Would the project be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?**

No Impact

A review of the California Department of Toxic Substances Control's EnviroStor web site did not result in the identification of any hazardous materials sites within the project site.

- d. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?**

Less than Significant

The nearest airport in the project vicinity is the Fresno Yosemite International Airport, which is located approximately two miles west of the project site. The proposed project is not located within the projected 60 dBA CNEL/L_{dn} noise contour of this airport (City of Clovis 2015). No private airstrips were identified within two miles of the project site. Implementation of the proposed project would not result in the exposure of sensitive receptors to excessive aircraft noise levels nor would the proposed project affect airport operations.

- e. Would the project impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan?**

Less than Significant

All schools have emergency response/evacuation plans. Fresno County's Public Health Emergency Preparedness (PHEP) is responsible for developing response plans to be used in the event of a large-scale threat to the health of residents of Fresno County. However, research conducted for this Initial Study did not identify any adopted emergency response plans or emergency evacuation plans the project could impair.

- f. Would the project expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires?**

Less than Significant

The project site is not within or near a state responsibility area or a very high fire hazard severity zone, therefore the risk of wildland fires would be considered low.

- g. CEQA Guidelines section 15186, Public Resources Code section 21151.8, Education Code Section 17213, and California Code of Regulations, Title 5, Section 14011[h], establish requirements for evaluating the safety of potential school sites. The purpose of the requirements is to ensure that potential health hazards resulting from exposure to any hazardous materials, wastes, and substances that may exist on a site will be carefully examined and disclosed in a negative declaration or EIR, and that the lead agency will consult with other agencies in this regard. The EIR or negative declaration must address the following concerns under the aforementioned sections:

Is the proposed school site:

- The site of a current or former hazardous waste or solid waste disposal facility and, if so, have the wastes have been removed;
- A hazardous substance release site identified by the Department of Toxic Substances Control in a current list adopted pursuant to Section 25356 of the Health and Safety Code for removal or remedial action pursuant to Chapter 6.8 (commencing with Section 25300) of Division 20 of the Health and Safety Code;
- The site of one or more buried or above ground pipelines that carry hazardous substances, acutely hazardous materials, or hazardous wastes, as defined in Division 20 of the Health and Safety Code? This does not include a natural gas pipeline used only to supply the school or neighborhood; and
- Within 500 feet of the edge of the closest traffic lane of a freeway or other busy traffic corridor.

In addition to addressing the preceding questions, Clovis Unified must determine if any permitted or non-permitted facilities, including but not limited to freeways and busy traffic corridors, large agricultural operations, and rail yards, are within one-fourth mile of the proposed school site that might reasonably be anticipated to emit hazardous emissions or handle hazardous or acutely hazardous material, substances, or waste.

As part of the Geological/Environmental Hazards Report (Appendix 5), AECOM conducted surveys for hazardous pipelines, electrical power lines, air toxics sources, aboveground storage tanks, and railroad tracks at the site and out to the respective radii from the site boundaries that are established for these various potential hazards in the California Education Code and/or in the CDE regulations or guidance documents. The following section uses information from the Report to evaluate the proposed school project.

Less than Significant

Hazardous Pipeline Survey

AECOM contacted the State Fire Marshal (SFM), the local natural-gas service provider (Pacific Gas and Electric Company [PG&E]), and Fresno Irrigation District (FID) regarding whether hazardous pipelines or high-volume water supply pipelines, as defined by CDE, are located within 1,500 feet of the site (see documentation in AECOM 2018, Appendix C). AECOM also reviewed maps of oil/gas/geothermal fields prepared by the California Division of Oil, Gas & Geothermal Resources (DOGGR), and conducted a field survey for pipeline markers visible at or from the site or from road rights-of-way within 1,500 feet of the site. AECOM found that:

- There are no pipelines jurisdictional to the SFM within 1,500 feet of the site.
- PG&E has no natural gas transmission pipelines within 1,500 feet of the site.
- FID knows of two irrigation water pipelines of 12-inches or greater in diameter that are within 1,500 feet of the site:
 - o FID's Gow No. 99 pipeline is 24 inches in diameter and runs north to south along the west side of Locan Avenue, west of the site.
 - o The private Gould No. 97 pipeline is believed to be at least 12 inches in diameter and runs north to south near the eastern boundary of the site.
- The site is not mapped as being within an oil, gas or geothermal field, so there was no need to contact DOGGR regarding potential pipelines.

- No pipeline markers were observed within 1,500 feet of the site.

As required by CCR Title 5 Section 14010(h), Clovis Unified must prepare a pipeline risk assessment to address the high volume irrigation pipelines in the vicinity of the site using established protocols. The risk assessment must show the pipelines are not a significant flooding hazard or safety risk in order for CDE to grant site approval. CDE must approve the site before construction can occur.

Electrical Powerline Survey

AECOM contacted the local electrical service provider (PG&E) regarding whether overhead electrical powerlines rated for greater than 50 kilovolts (kv) are located within 350 feet of the site (see documentation in AECOM 2018, Appendix C). AECOM also conducted a field survey for such powerlines visible at or from the site or from road rights-of-way within 350 feet of the site. AECOM found that:

- There are no PG&E overhead electrical transmission powerlines rated for greater than 50 kv within 350 feet of the site.
- No electrical powerlines were observed within 350 feet of the site, other than distribution powerlines, which are typically rated at 21 kv or less.

Hazardous Air Emissions/Hazardous Materials Survey

AECOM contacted the Fresno County Environmental Health Division (FCEHD) and the San Joaquin Valley Air Pollution Control District (SJVAPCD) regarding whether there are facilities that may produce hazardous air emissions and/or handle hazardous materials within ¼ mile of the site (see documentation in AECOM 2018, Appendix C). AECOM also conducted a field survey for such facilities within ¼ mile of the site that are visible at or from the site or from road rights-of-way. AECOM found that:

- The FCEHD found no such facilities located within ¼ mile of the site.
- The SJVAPCD reported no permitted facilities located within ¼ mile of the site.

Aboveground Storage Tanks Survey

AECOM contacted FID regarding whether there are aboveground fuel or water storage tanks located within ¼ mile of the site (see documentation in AECOM 2018, Appendix C). AECOM also reviewed a 2014 aerial photograph and conducted a field survey for such storage tanks visible at or from the site or from road rights-of-way within ¼ mile of the site. AECOM found that:

- FID has no such storage tanks within ¼ mile of the site.
- Aboveground propane tanks are present at the two residences that are between the western border of the site and North Locan Avenue. Other nearby residences or businesses may also have propane tanks that were not observable.

As required by CCR Title 5 Section 14010(h), the propane tanks must be evaluated and found not to be a significant safety risk to the site in order for CDE to grant site approval. CDE must approve the site before construction can occur.

Railroad Track Survey

AECOM reviewed a 2014 aerial photograph and a 1981 USGS topographic map and conducted a field survey for railroad tracks located within 1,500 feet of the site. AECOM found that there do not appear to be any railroad tracks located within 1,500 feet of the site.

10. Hydrology and Water Quality

- a. **Would the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?**

Less than Significant

Although the project site will not be annexed to the City of Fresno in conjunction with project approval and construction, water and sewer service will be provided to Clovis Unified through an extraterritorial agreement with the City of Fresno (Appendix 1). The City of Fresno's water supply system complies with

applicable water quality standards and the City's wastewater discharge system complies with applicable waste discharge requirements. The design and operational characteristics of the project related to water and wastewater would not incrementally or directly cause the City's systems to violate the applicable requirements.

- b. Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?**

Less than Significant

The City of Fresno obtains its water supply from groundwater from the Kings Sub-basin and surface water from the San Joaquin River. The Kings Sub-basin is substantially overdrafted. The Sustainable Groundwater Management Act (SGMA) was signed into law in 2014 to remedy unsustainable groundwater depletion in groundwater basins in California. SGMA requires the development and adoption of Groundwater Sustainability Plans (GSPs) by 2020 and that all high and medium priority groundwater basins must reach sustainability by 2040. The City of Fresno is a member of the North Kings Groundwater Sustainability Agency, which is responsible for developing a Groundwater Sustainability Plan. The City's surface water entitlements, under a new (December 2016) agreement between Fresno Irrigation District and the City of Fresno, are generally not available to territory within the Southeast Development Area (SEDA). As a condition of the extraterritorial agreement; however, the water supply necessary for the project will be provided by the District either through assignment of water entitlements associated with the property, the acquisition of additional surface water rights or the payment of a fee per acre-foot of water needed for the project to the City of Fresno. Therefore, the project will have a less than significant impact on groundwater supplies.

The proposed project would reduce the amount of land available for groundwater recharge by covering existing vacant land with impermeable road, building, and hardcourt surfaces. However, most of the project site will consist of permeable turfed playground and athletic fields areas that would allow for groundwater recharge. The project site will drain to an on-site storm water retention basin, which will also contribute to groundwater recharge. Therefore, the project would not interfere substantially with groundwater recharge.

- c. Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or through the addition of impervious surfaces, in a manner that would**

- **Result in substantial erosion or siltation on- or off-site;**
- **Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on-or off-site;**
- **Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or**
- **Impede or redirect flood flows**

Less than Significant

No streams or rivers exist on the project site.

Grading required for the proposed project would change the existing drainage pattern within the project site, and the additional covered surfaces would increase the amount of surface runoff and, potentially, the rate of runoff. The runoff would have the potential to degrade surface and groundwater quality if not properly controlled.

The Fresno Metropolitan Flood Control District (FMFCD) is responsible for managing urban stormwater runoff within the Fresno area. The site is within FMFCD Drainage Area "DS". Permanent drainage service is currently not available in Drainage Area "DS"; however, FMFCD's future Master Plan drainage system in Drainage Area "DS" will have the capacity to serve the project as indicated in FMFCD's letter to Clovis Unified dated March 21, 2018, and incorporated by reference in this Initial Study. The project will be served by an on-site storm water retention basin until permanent drainage facilities are available. The District will

enter into an agreement with FMFCD that will include Items 2a through 2d in FMFCD's letter to facilitate the provision of such permanent service.

Before beginning construction, Clovis Unified must prepare a Stormwater Pollution Prevention Plan (SWPPP). The SWPPP is a site-specific plan that is designed to control the discharge of pollutants from the construction site to local storm drains and waterways.

Based on the above, the project's impacts related to increased surface runoff and potential polluted runoff are less than significant.

- d. Would the project result in flood hazard, tsunami, or seiche zones, risk release of pollutants due to inundation?**

Less than Significant

Major flooding is not expected at the site, but sheet overland flow and pooling in low areas is probable during heavy or prolonged storms.

Based on the site's distance from the ocean, tsunami hazards at the site are not considered possible.

No large bodies of water have been identified within approximately 15 miles of the site. Therefore, seiche hazards at the site are not considered possible.

According to DWR records, there are 33 dams located within Fresno County [Fresno County, 2000]. Of these, four major dams could cause substantial flooding in Fresno County in the event of a failure: Friant Dam, Big Dry Creek Dam, Redbank-Fancher Creek Project Dams, and Pine Flat Dam. Failure of these dams is considered a very unlikely event. The site is located outside the flood inundation areas in the event of failure of these dams.

- e. Would the project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?**

Less than Significant

The project site is subject to the Water Quality Control Plan for the San Joaquin River Basins. As such, this project will comply with applicable policies and standards.

The Sustainable Groundwater Management Act of 2014 (SGMA) requires the formation of local Groundwater Sustainability Agencies (GSAs) who are responsible for developing Groundwater Sustainability Plans (GSPs). The project site is located within jurisdiction of the North Kings Groundwater Sustainability Agency. This new agency has not yet developed a GSP.

11. Land Use and Planning

- a. Would the project physically divide an established community?**

Less than Significant

The location and scale of the proposed school would not physically divide the City of Fresno because the project site is located adjacent to the city limits with no existing urban development to the east or south. Elementary, middle, and high schools are usually located in residential neighborhoods and often serve as unifying elements for the neighborhoods.

- b. Would the project cause a significant environmental impact due to a conflict with any land use plan, policy or regulation adopted for the purpose of avoiding or mitigating an environmental effect?**

Less than Significant

Schools and related improvements and activities are typically considered to be an appropriate and necessary land use component of a well-balanced neighborhood and community. Schools are permitted under the land use and corresponding zoning designations of the City of Fresno. Schools are permitted in the Fresno County AE-20 zone district subject to the granting of a Director Review and Approval. Although

the project is outside the city limits, it will serve existing students within the city limits. The project site is contiguous to existing urban residential development and would not constitute “leap frog” development.

12. Mineral Resources

Would the project:

- **Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?**
- **Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?**

No Impacts

The project would not result in the loss of availability of a known mineral resource because no known resources exist on or near the proposed school site. Likewise, the project would not result in the loss of availability of a locally important mineral resource recovery site because none exists on or near the proposed school site. (City of Fresno General Plan EIR (2014)).

13. Noise

This section is based on Noise Impact Analysis (Ambient 2018b) prepared for the project which is included as Appendix 6 to this Initial Study.

- a. **Would the project result in the exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?**

Less than Significant

The Fresno County General Plan Noise Element includes noise standards for determination of land use compatibility for new land uses. The County’s “normally acceptable” exterior noise standards for schools is 65 dBA CNEL/L_{dn}.

Ambient noise levels in the project area are largely influenced by traffic noise emanating from Locan Avenue. Under future cumulative conditions, with project-generated vehicle traffic included, the predicted 65 dBA CNEL/L_{dn} noise contour would extend to a distance of approximately 96 feet from the centerline of Locan Avenue. The nearest proposed educational structure would be located in excess of approximately 950 feet from Locan Avenue. Predicted exterior noise levels at the nearest proposed educational structures would be approximately 46 dBA CNEL/L_{dn}. In addition, proposed on-site recreational land uses would not be located within the projected 65 dBA CNEL/L_{dn} noise contour. Predicted noise levels would not exceed the County’s “normally acceptable” exterior noise standard of 65 dBA CNEL/L_{dn}.

Based on the exterior noise levels noted above and assuming an average exterior-to-interior noise reduction of 25 dB, which is typical for new building construction, predicted interior background noise levels would be approximately 21 dBA CNEL/L_{dn}, with windows closed. Based on these same assumptions and assuming an average exterior-to-interior noise reduction of 15 dB, with windows open, predicted interior noise levels would be approximately 31 dBA CNEL/L_{dn}. Predicted noise levels at the proposed school would not exceed the commonly applied interior noise standard of 45dBA CNEL/L_{dn}.

- b. **Would the project result in the exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?**

Less than Significant

Long-term operational activities associated with the proposed project would not involve the use of any equipment or processes that would result in potentially significant levels of ground vibration. Increases in groundborne vibration levels attributable to the proposed project would be primarily associated with short-term construction-related activities. Construction activities associated with the proposed improvements

would likely require the use of various off-road equipment, such as tractors, concrete mixers, and haul trucks. The use of major groundborne vibration-generating construction equipment, such as pile drivers, would not be required for this project.

Groundborne vibration levels associated with representative construction equipment are summarized in Ambient 2018b, Table 9. As depicted, ground vibration generated by construction equipment would be approximately 0.08 in/sec ppv, or less, at 25 feet. Predicted vibration levels at the nearest existing structures would not exceed the minimum recommended criteria for structural damage and human annoyance (0.2 in/sec ppv, respectively).

c. Would the project result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

Less than Significant with Mitigation

Long-term increases in ambient noise levels associated with the proposed project would be associated with increases in vehicle traffic along area roadways. To a lesser extent, on-site non-transportation noise sources would also contribute to potential increases in ambient noise levels. Noise levels associated with project-generated traffic and non-transportation sources are discussed below.

Roadway Traffic

Predicted existing traffic noise levels, with and without implementation of proposed project, are summarized in Ambient 2018b, Table 10. In comparison to existing traffic noise levels, the proposed project would result in a predicted increase in traffic noise levels of approximately 0.4 to 1.5 dBA.

Predicted increases in future cumulative traffic noise levels along nearby roadways for proposed project are summarized in Ambient 2018b, Table 11. In future years, the project's contribution to cumulative traffic noise levels would be anticipated to decline as increases in vehicle traffic due to surrounding development increases. Under future cumulative conditions, the proposed project would result in predicted increases in traffic noise levels of approximately 0.1 to 0.5 dBA.

Changes in ambient noise levels of approximately 3 dBA, or less, are typically not discernible to the human ear and would not be considered to result in a significant impact. Implementation of the proposed project would not result in a significant increase in traffic noise levels along area roadways. Other less-affected area roadways would, likewise, not experience a significant increase in traffic noise levels. Project-generated increases in traffic noise levels would be considered to have a less-than-significant impact.

Mechanical Building Equipment

The proposed project would include the construction of new buildings, primarily within the southeastern portion of the project site (refer to Ambient 2018b, Figure 2). Mechanical building equipment (e.g., heating, ventilation and air conditioning systems) can result in noise levels of approximately 90 dBA at 3 feet from the source. However, mechanical equipment systems are typically shielded from direct public exposure and housed on rooftops, within equipment rooms, or within exterior enclosures.

The nearest on-site structures would be located in excess of approximately 235 feet from the eastern property line and approximately 420 feet from the southern property line. Based on these distances and assuming an uninterrupted noise level of 90 dBA Leq at 3 feet, predicted operational noise levels associated with on-site building mechanical equipment would approximately 52 dBA Leq at the eastern property line and approximately 47 dBA Leq at the southern property line. Operational noise levels would be limited primarily to the daytime hours of school operations and would be intermittent. Given that building mechanical equipment is typically shielded from direct public exposure and placed on rooftops, actual noise levels would likely be substantially less. Operational noise levels for building mechanical equipment would not exceed the County of Fresno's daytime noise standard of 55 dBA Leq. As a result, the operation of building mechanical equipment would be considered to have a less-than-significant impact.

Exterior Recreational-Use Facilities

The proposed project includes construction of ball fields within the western and northern portions of the project site. A track and ball courts are also proposed within the northeastern portion of the project site.

Recreational facilities would be used primarily during the daytime hours and would typically not be used for competitive events that would involve large spectator crowds. The locations of the proposed recreational-use facilities are depicted in Ambient 2018b, Figure 2.

Based on noise measurements conducted for similar projects, average-hourly noise levels associated with elementary school recreational-use facilities, including ball fields and ball courts, typically average 60 dBA L_{eq} , or less, at the field edge and at approximately 50 feet from spectator areas. Intermittent noise events typically associated with such uses include individuals yelling and the intermittent sound of the hitting and bouncing of balls. Major competitive events involving large spectator crowds and the use of amplified sound/public address (PA) systems are typically not associated with elementary school facilities. In addition, the proposed track would not be paved and would not be used for major competitive events.

The nearest residential land uses are located adjacent to the southern, northern and eastern boundaries the school site. Residential land uses are also located west of the proposed school site, across Locan Avenue (refer to Ambient 2018b, Figure 2). Assuming that on-site recreational uses were to be limited to the daytime hours of operation, predicted noise levels associated with use of baseball fields could reach levels of approximately 64 dBA CNEL/ L_{dn} at the nearest residential property lines located adjacent to and north of the project site.

Predicted noise levels associated with the on-site soccer fields, track, and ball courts would range from approximately 58-61 dBA CNEL/ L_{dn} at the nearest residential property lines located north of the project site. Predicted noise levels at residential land uses located to the east, west, and south of the project site would be approximately 55 dBA CNEL/ L_{dn} or less. Because predicted noise levels at residential land uses located adjacent to the northern property boundary of the project site could potentially exceed the noise standard of 60 dBA CNEL/ L_{dn} , this impact is considered potentially significant.

On-site Vehicle Parking Areas

Noise levels commonly associated with parking lots are generated by the starting of vehicles, the opening and closing of vehicle doors, playing of amplified music, and the occasional sound of vehicle alarms and horns. Intermittent noise levels associated with such noise events can generate sound levels of up to approximately 92 dBA at 50 feet. Overall, average-hourly noise levels associated with parking lots are largely dependent on vehicle activity and, thus, would likely be greatest during the hours preceding or upon conclusion of school operations.

The proposed project would result in the development of an approximate 81-space vehicle parking lot located along the southern boundary of the project site, as well as, an approximate 43-space parking lot located near the eastern boundary of the project site (refer to Ambient 2018b, Figure 2). Noise levels associated with on-site vehicle parking areas were predicted assuming that all proposed vehicle parking spaces would be accessed within a one-hour period. Based on the modeling conducted, the highest daytime hourly noise levels at the nearest residential property lines would range from approximately 42 to 45 dBA L_{eq} . Predicted noise levels would not exceed the City's daytime noise standard of 55 dBA L_{eq} . As a result, this impact is considered less than significant.

Facility Maintenance

Exterior noise events associated with the maintenance of school facilities are typically associated with the operation of landscape maintenance equipment, as well as, occasional waste-collection activities. Based on measurements conducted at similar facilities, landscape maintenance equipment, such as leaf blowers and gasoline powered lawn mowers; as well as waste collection activities can result in intermittent noise levels of up to approximately 100 dBA at 3 feet (EPA 1971). Resultant exterior noise levels could reach intermittent levels of approximately 75 dBA at 50 feet. The hours during which landscape maintenance and waste collection activities would be conducted have not yet been specified, nor has the location of on-site waste-collection facilities been identified. In the event that landscape maintenance and waste collection activities were to occur during the more noise-sensitive nighttime hours, the intermittent noise levels associated with these activities could result in increased levels of annoyance and potential sleep disruption to occupants of nearby residential dwellings. As a result, increases in noise levels associated with facility maintenance activities would be considered potentially significant.

Mitigation Measure N-1: The following measures shall be implemented to reduce long-term operational noise impacts:

- a. The use of on-site recreational facilities shall be limited to between the hours of 7:00 a.m. to 10:00 p.m.
- b. The use of amplified sound/PA systems for on-site recreational facilities shall be prohibited.
- c. A noise barrier shall be constructed along the northern boundary of the project site to a minimum height of 6 feet above ground level. The barrier should be constructed out of masonry block or material of similar density and usage.
- d. Noise-generating maintenance activities, such as landscape maintenance and waste collection activities, shall be limited to between the hours of 7:00 a.m. to 10:00 p.m. Waste-collection areas should be located at the furthest distance possible from adjacent residential land uses.

Implementation of the above mitigation measures would prohibit the use of amplified sound/PA systems and would require the installation of a noise barrier along the northern boundary of the project site, which would reduce recreational use noise levels by approximately 5-6 dB. With installation of the proposed sound barrier, predicted noise levels associated with onsite recreational uses would be reduced to below 60 dBA CNEL/L_{dn} at the residential land uses located adjacent to the northern site boundary. Additional measures have also been incorporated to minimize potential increases in levels of annoyance and sleep disruption to occupants of nearby residences associated with the use of proposed recreational facilities and on-site maintenance activities. With mitigation, this impact would be considered less than significant.

- d. **Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?**

Less than Significant with Mitigation

Construction noise typically occurs intermittently and varies depending upon the nature or phase (e.g., demolition/land clearing, grading and excavation, erection) of construction. Noise generated by construction equipment, including earth movers, material handlers, and portable generators, can reach high levels. Although noise ranges were found to be similar for all construction phases, the initial site preparation phase tended to involve the most equipment. As noted in Ambient 2018b, Table 11, noise levels generated by individual pieces of construction equipment typically range from approximately 74 dBA to 89 dBA L_{max} at 50 feet (FTA 2006). Typical operating cycles may involve 2 minutes of full power, followed by 3 or 4 minutes at lower settings. Average hourly noise levels at construction sites typically range from approximately 65 to 89 dBA L_{eq} at 50 feet, depending on the activities performed.

Based on the equipment noise levels presented in Ambient 2018b, Table 11 and assuming a noise attenuation rate of 6 dBA per doubling of distance from the source, exterior noise levels at nearby residences located within approximately 1,500 feet and within line-of-sight of construction activities could exceed 60 dBA without feasible noise control. Activities occurring during the more noise-sensitive nighttime hours would be of particular concern given the potential for increased levels of annoyance and sleep disruption to occupants of nearby residential dwellings.

The proposed project does not include hourly restrictions for construction activities. Typically, construction-related activities occurring during the nighttime hours (i.e., 10:00 p.m. to 7:00 a.m.) would not be exempt from noise ordinance requirements. As a result, given that construction activities could potentially occur during the more noise-sensitive periods of the day, noise-generating construction activities would be considered to have a potentially significant short-term noise impact.

Use of mufflers would reduce individual equipment noise levels by approximately 10 dBA. Implementation of the above mitigation measures would limit construction activities to the less noise-sensitive periods of the day. With implementation of the mitigation measure below, this impact would be considered less than significant.

Mitigation Measure N-2: The following measures shall be implemented to reduce construction-generated noise levels:

- a. Construction activities (excluding activities that would result in a safety concern to the public or construction workers) shall be limited to between the hours of 7:00 a.m. and 10:00 p.m. Construction activities shall be prohibited on Sundays and legal holidays.
- b. Construction equipment shall be properly maintained and equipped with noise-reduction intake and exhaust mufflers and engine shrouds, in accordance with manufacturers' recommendations. Equipment engine shrouds shall be closed during equipment operation.
- c. When not in use, all equipment shall be turned off and shall not be allowed to idle. Provide clear signage that posts this requirement for workers at the entrances to the site.

14. Population and Housing

- a. **Would the project induce substantial unplanned population growth either in an area, directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?**

Less than Significant

School facilities are planned and built as a result of new urban development creating a demand for the schools. Without urban development, new schools would generally not be needed (except in cases where demographic or economic changes in existing urban areas create a need for additional school facilities). However, the act of building a planned new school needed to serve existing and/or planned urban development can make it more desirable to live in an area and in some cases can extend infrastructure that can serve as an impetus for new growth. The project involves the extension of roads and the water and sewer infrastructure necessary to serve the project; however, Clovis Unified is proposing the project in response to recently constructed and planned new residential development in the City of Fresno, which has already been evaluated under the Fresno General Plan EIR. The project would not have a growth inducing effect for any new development that was not already planned and anticipated by the City.

- b. **Would the project displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?**

No Impact

The proposed school site has no existing housing.

15. Public Services

- a. **Would the project result in substantial adverse physical impacts associated with the provision of new or altered governmental facilities, need for new or altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services: fire protection, police protection, schools, parks, and other public facilities?**

Less than Significant

The project would not result in the need for new or physically altered fire protection, police protection, parks, other public facilities in order to maintain acceptable service ratios, response times or other performance objectives. The project site is contiguous to existing urban development where City of Fresno facilities and services are already available. The City Fire Department indicated that the project site is between 2.0 and 3.0 miles from the nearest fire station and, therefore, Fresno Fire Department Planning Standards require that all commercial and institutional development beyond 2.0 miles from a fire station be fire sprinklered. Neither the City of Fresno or County of Fresno law enforcement agencies indicated concern regarding the project. It is noted that Clovis Unified has its own police department. The project is

a school, the impacts of which are addressed in other sections of this Initial Study and have been found to be *less than significant* with incorporation of the mitigation measures detailed in the other sections of this Initial Study.

16. Recreation

- a. **Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?**

No Impact

The project would not increase the demand for or use of existing park and recreation facilities. Instead, the proposed schools would add to the grounds and facilities within the community that Clovis Unified could make available to the community for recreational and other uses.

- b. **Does the project include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment?**

Less than Significant

The proposed school would include recreational facilities for physical education purposes. This Initial Study addresses impacts associated with the development of the facilities as an integral part of the evaluation of impacts in Sections E, 1-19.

17. Transportation

The discussion of transportation and traffic impacts in this section primarily reflects information in the Traffic Impact Analysis (TIA) prepared for the project by JLB Traffic Engineering, Inc. (JLB 2018), which is included as Appendix 7 to this Initial Study (Note: Table E-17-1 provides definitions for traffic-related terms used in this section.)

**TABLE E-17-1
Transportation/Traffic Definitions and Standards**

Roadway Categories
<ul style="list-style-type: none">• Expressways: Expressways provide for through traffic movement on continuous routes through a city. It generally connects with arterials, highways, freeways. Also, it connects a city with other cities. Expressways are generally four lane roadways, divided and undivided. Access to expressways is typically restricted to signalized intersections with arterial and collector streets. There are no expressways in the vicinity of this project.• Arterials: Arterials are designed to move large volumes of traffic and are intended to provide a high level of mobility between freeways, expressways, other arterials, and collector roadways. Arterials also provide non-freeway/highway connections between major residential, employment, and activity centers. Unlike freeways, they are intended not only for motor vehicles, but also for bicycles and pedestrians. Arterial streets typically have more right-of-way and a higher degree of access control than collector roadways.• Collectors: Collector streets provide for relatively short distance travel between and within neighborhoods. Collectors are not designed to handle long-distance through-traffic. Driveway access to collectors is less limited than on arterials. Speed limits on these streets are typically lower than those found on arterials.• Local Streets: Local streets are designed to provide direct roadway access to abutting land uses and serve short distance trips within neighborhoods. Traffic volumes and speed limits on local streets are low, and these roadways have no more than two travel lanes.

Level of Service

The Level of Service (LOS) is the primary measure of roadway performance. LOS is a qualitative description of traffic flow from the perspective of motorists. The Highway Capacity Manual (HCM) developed by the Transportation Research Board defines the following six levels of service from LOS A to LOS F. These grades represent the perspective of drivers only and are an indication of the comfort and convenience associated with driving, as well as speed, travel time, traffic interruptions, and freedom to maneuver.

- Level of Service A: Free-flow operations. Drivers are almost completely unimpeded in their ability to maneuver within the traffic stream.
- Level of Service B: Free-flow speeds are maintained. The ability to maneuver within the traffic stream is only slightly restricted.
- Level of Service C: Traffic flow with speeds at or near free-flow speed. The freedom to maneuver within the traffic stream is noticeably restricted, and lane changes require more care and vigilance on the part of the driver.
- Level of Service D: Speeds begin to decline slightly with increasing flows. Freedom to maneuver within the traffic stream is noticeably limited.
- Level of Service E: Operations at or near capacity. There are virtually no useable gaps within the traffic stream, leaving little room to maneuver.
- Level of Service F: Breakdown in vehicular flow. Vehicular demand exceeds capacity. (Fehr and Peers 2014)

AM Peak Hour/PM Peak Hour

For purposes of this Initial Study,

- AM Peak Hour (or morning peak hour) means the average vehicle trip ends versus dwelling units for residential units and students for elementary schools on a weekday (Tuesday, Wednesday or Thursday only), peak hour of adjacent street traffic, one hour between 7 and 9 a.m.
- PM Peak Hour (or evening peak hour) means the average vehicle trip ends versus dwelling units for residential units and students for elementary schools on a weekday (Tuesday, Wednesday or Thursday only), peak hour of adjacent street traffic, one hour between 2 and 4 p.m.

- a. **Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?**

Less than Significant with Mitigation

Criteria of Significance

The City of Fresno 2035 General Plan has established various degrees of acceptable LOS on its major streets that are dependent on four (4) Traffic Impact Zones (TIZ) within the City. The standard LOS threshold for TIZ I is LOS F, that for TIZ II is LOS E, that for TIZ III is LOS D, and that for TIZ IV is LOS E. Additionally, the 2035 MEIR made findings of overriding consideration to allow a lower LOS threshold than that established by the underlying TIZs. For those cases in which a LOS criterion for a roadway segment differs from that of the underlying TIZ, such criteria are identified in the roadway description. As all study facilities fall within TIZ III, LOS D is used to evaluate the potential significance of LOS impacts to intersections and segments within this TIA pursuant to the City of Fresno 2035 General Plan.

The County of Fresno has established LOS C as the acceptable level of traffic congestion on county roads and streets that fall entirely outside the Sphere of Influence (SOI) of a City. For those areas that fall within the SOI of a City, the LOS criteria of the City are the criteria of significance used in this report. LOS C is used to evaluate the potential significance of LOS impacts to Fresno County intersections and segments, which

fall outside the City of Fresno SOI. In this case, all study facilities fall within the City of Fresno SOI, therefore the City of Fresno LOS is utilized.

Caltrans endeavors to maintain a target LOS at the transition between LOS C and D on State highway facilities consistent with the *Caltrans Guide for the Preparation of Traffic Impact Studies* dated December 2002. However, Caltrans acknowledges that this may not always be feasible and recommends that the lead agency consult with Caltrans to determine the appropriate target LOS. In this TIA, however, all study facilities fall within the City of Fresno. Therefore, the City of Fresno LOS thresholds are utilized.

Existing Traffic Conditions

Roadway Network

Temperance Avenue is an existing north-south, predominantly two-lane undivided collector in the vicinity of the proposed Project. Temperance Avenue extends south from the City of Clovis SOI beyond the City of Fresno SOI. The City of Fresno 2035 General Plan Circulation Element designates Temperance Avenue as a six-lane super arterial through the City of Fresno SOI. Furthermore, the City of Fresno 2035 General Plan Circulation Element acknowledged that Temperance Avenue would exceed LOS D as a six-lane facility between Shields Avenue and McKinley Avenue. However, City Council made the appropriate findings to designate LOS E as the criteria of significance for Temperance Avenue as a six-lane facility between Shields Avenue and McKinley Avenue.

Locan Avenue is an existing north-south, predominantly two-lane collector in the vicinity of the proposed Project. In this area, Locan Avenue extends south from the City of Clovis SOI to Clinton Avenue. The City of Fresno 2035 General Plan Circulation Element designates Locan Avenue as two-lane collector north of Clinton Avenue.

DeWolf Avenue is an existing north-south two-lane collector in the vicinity of the proposed Project. In this area, DeWolf Avenue extends south from the City of Clovis SOI through the City of Fresno SOI. The City of Fresno 2035 General Plan Circulation Element designates DeWolf Avenue as a two-lane collector south of the City of Clovis SOI to McKinley Avenue, a four-lane collector between McKinley Avenue and Tulare Avenue, and a two- to four-lane arterial south of Tulare Avenue through the City of Fresno SOI.

Ashlan Avenue is an existing east-west four-lane divided arterial in the vicinity of the proposed Project. In this area, Ashlan Avenue extends east from the City of Fresno SOI beyond the City of Clovis SOI. The City of Clovis 2035 General Plan Circulation Element designates Ashlan Avenue as a four-lane arterial between Winery Avenue and Minnewawa Avenue and Sunnyside Avenue and McCall Avenue and a two-lane collector between Minnewawa Avenue and Sunnyside Avenue and east of McCall Avenue through the City of Clovis SOI.

Shields Avenue is an existing east-west roadway in the vicinity of the proposed Project. In this area, Shields Avenue is a four-lane divided arterial between Clovis Avenue and Temperance Avenue, a three-lane divided arterial between Temperance Avenue and Locan Avenue, and a two-lane undivided collector east of Locan Avenue through the City of Fresno SOI. The City of Fresno 2035 General Plan Circulation Element designates Shields Avenue as a four-lane divided arterial between Clovis Avenue and Temperance Avenue, a two-lane divided arterial between Temperance Avenue and Locan Avenue, and a two-lane collector east of Locan Avenue through the City of Fresno SOI.

State Route 180 is an existing east-west six-lane freeway in the vicinity of the proposed Project. State Route 180 connects southeast and southwest Fresno with Downtown Fresno and has freeway-to-freeway interchanges at State Route 41, State Route 99 and State Route 168. East of Fresno, State Route 180 also provides access to Kings Canyon and Sequoia National Parks. West of Fresno, State Route 180 connects to the cities of Kerman and Mendota.

Transit

Fresno Area Express (FAX) is the transit operator in the City of Fresno. At present, there are no FAX transit routes that operate in the vicinity of the proposed Project. The closest is FAX Route 45, which runs on Princeton Avenue and Fowler Avenue, approximately 1.60 miles to the west of the proposed Project. Route 45 operates at 60-minute intervals on weekdays and weekends and its nearest stop to the Project site is

located on the south side of Princeton Avenue, approximately 150 feet west of Fowler Avenue. This route provides a direct connection to Palm Lakes Golf Course, Bullard High School, Gillis Library, Fresno High School, Fresno City College, Manchester Transit Center, Army Navy Reserve and the Shields/Fowler Industrial Park. Retention of the existing and expansion of future transit routes is dependent on transit ridership demand and available funding.

Bikeways

Currently, bike lanes exist in the vicinity of the proposed Project site along Ashlan Avenue and portions of Locan Avenue, Temperance Avenue and Shields Avenue. The City of Clovis 2035 General Plan Circulation Element recommends that Class II Bike Lanes be implemented on: 1) Locan Avenue south of Herndon Avenue through the City of Clovis SOI, 2) Ashlan Avenue between Winery Avenue and McCall Avenue, 3) Temperance Avenue south of Shepherd Avenue through the City of Clovis SOI, and 4) DeWolf Avenue south of Herndon Avenue through the City of Clovis SOI. Also, the City of Clovis 2035 General Plan Circulation Element recommends that a Class I Multipurpose Trail be implemented on: 1) Ashlan Avenue between DeWolf Avenue and Leonard Avenue and 2) DeWolf Avenue south of Ashlan Avenue through the City of Clovis SOI. The City of Fresno "Bicycle, Pedestrian & Trails Master Plan" recommends that Class II Bike Lanes be implemented on: 1) Locan Avenue north of Clinton Avenue through the City of Fresno SOI, 2) Temperance Avenue through the City of Fresno SOI, 3) Shields Avenue between Clovis Avenue and Highland Avenue, and 4) DeWolf Avenue north of Jensen Avenue. Also, the City of Fresno "Bicycle, Pedestrian & Trails Master Plan" recommends that a Class I Bike Path be implemented on 1) the west side of Temperance Avenue through the City of Fresno SOI and 2) Locan Avenue between Clinton Avenue and Olive Avenue. Therefore, it is recommended that the Project implement a Class II bike lane along its frontage to Locan Avenue.

Walkways

A pedestrian hybrid beacon warrant analysis was conducted across Locan Avenue at Cortland Avenue under the Existing plus Project Traffic Conditions scenario. The analysis was prepared for both a high-speed roadway (consistent with the posted speed limit) and a low-speed roadway (assuming the 85th percentile speed is reduced after the Project is built). The results of the analysis under both conditions are found in JLB 2018, Appendix J. Under this scenario and both conditions, the installation of a pedestrian hybrid beacon is warranted for Locan Avenue and Cortland Avenue. Therefore, it is recommended that a high visibility crosswalk be installed across Locan Avenue, preferably located on the north side of Cortland Avenue. Also, as part of the Project, walkways should be constructed along the Project's frontage to Locan Avenue. Where possible, walkways should be a minimum of six (6) feet wide and be separated from the street by a park strip to provide some separation between pedestrians and the paved portions of the road. The implementation of these recommendations coupled with the necessary school zone signage and markings will promote pedestrian safety.

Study Facilities

The existing peak hour turning movement and segment volume counts were conducted at the study intersections and segments in April 2018 while schools in the vicinity of the Project were in session. The intersection turning movement counts included pedestrian volumes. The traffic counts for the existing study intersections and segments are contained in JLB 2018, Appendix B. The existing intersection turning movement volumes, intersection geometrics and traffic controls are illustrated in JLB 2018, Figure 2.

Intersections

1. Locan Avenue / Ashlan Avenue
2. Temperance Avenue / Shields Avenue
3. Locan Avenue / Shields Avenue
4. DeWolf Avenue / Shields Avenue

Segments

1. Locan Avenue between Ashlan Avenue and Shields Avenue
2. Shields Avenue between Temperance Avenue and Locan Avenue
3. Shields Avenue between Locan Avenue and DeWolf Avenue

Project Only Trips to State Facilities

1. State Route 180 / Temperance Avenue

Study Scenarios

Existing Traffic Conditions

This scenario evaluates the Existing Traffic Conditions based on existing traffic volumes and roadway conditions from traffic counts and field surveys conducted in the year 2018.

Existing plus Project Traffic Conditions

This scenario evaluates total traffic volumes and roadway conditions based on the Existing plus Project Traffic Conditions. The Existing plus Project traffic volumes were obtained by adding the Project Only Trips to the Existing Traffic Conditions scenario. The Project Only Trips to the study intersections were developed based on the anticipated school boundary, existing travel patterns, data provided by the developer, the existing roadway network, engineering judgment, existing residential and commercial densities, and the City of Fresno 2035 General Plan Circulation Element in the vicinity of the Project.

Near Term plus Project Traffic Conditions

This scenario evaluates total traffic volumes and roadway conditions based on the Near Term plus Project Traffic Conditions. The Near Term plus Project traffic volumes were obtained by adding the Near Term related trips to the Existing plus Project Traffic Conditions scenario.

Cumulative Year 2035 No Project Traffic Conditions

This scenario evaluates total traffic volumes and roadway conditions based on the Cumulative Year 2035 No Project Traffic Conditions. The Cumulative Year 2035 No Project traffic volumes were obtained by subtracting the Project Only Trips from the Cumulative Year 2035 plus Project Traffic Conditions scenario.

Cumulative Year 2035 plus Project Traffic Conditions

This scenario evaluates total traffic volumes and roadway conditions based on the Cumulative Year 2035 plus Project Traffic Conditions. The Cumulative Year 2035 plus Project traffic volumes were obtained from the Fresno COG traffic model runs (Base Year 2018 and Cumulative Year 2035) and existing traffic counts. Under this scenario, the increment method, as recommended by the Model Steering Committee was utilized to determine the Cumulative Year 2035 plus Project traffic volumes. The Fresno COG Models are contained in JLB 2018, Appendix C.

Project Access

Based on latest Project Site Plan, access to and from the Project site will from two (2) access points. One of the access points is located on the east side of Locan Avenue approximately 750 feet north of Shields Avenue. This access point is an eastern extension of the existing Cortland Avenue. Although the Project's main access will be the eastern extension of Cortland Avenue off of Locan Avenue, the Project will also have a connection to the existing residential subdivision located to the north through Jewel Avenue.

JLB analyzed the location of the proposed access points relative to the existing local roads and driveways in the Project's vicinity. A review of the Project driveways to be constructed indicates that they are located at points that minimize traffic operational impacts to the existing roadway network.

Trip Generation

Trip generation rates for the proposed Project were obtained from the 10th Edition of the Trip Generation Manual published by the Institute of Transportation Engineers (ITE). Table E-17-2 presents the trip generation for the proposed Project with trip generation rates for an Elementary School. At buildout, the proposed Project is estimated to generate a maximum of 1,418 daily trips, 503 AM peak hour trips and 128 PM peak hour trips.

TABLE E-17-2
Project Trip Generation

Land Use (ITE Code)	Size	Unit	Daily		(7-9) AM Peak Hour						(4-6) PM Peak Hour					
			Rate	Total	Trip Rate	In	Out	In	Out	Total	Trip Rate	In	Out	In	Out	Total
						%						%				
Elementary School (520)	750	students	1.89	1,418	0.67	54	46	272	231	503	0.17	48	52	61	67	128
Total Project Trips				1,418				272	231	503				61	67	128

Trip Distribution

The trip distribution assumptions were developed based on anticipated school boundary, existing travel patterns, data provided by the developer, the existing roadway network, engineering judgment, existing residential and commercial densities, and the City of Fresno 2035 General Plan Circulation Element in the vicinity of the Project. Figure 4 in JLB 2018 illustrates the Project Only Trips to the study intersections.

Conclusions and Recommendations

Existing Traffic Conditions

- At present, the intersection of DeWolf Avenue and Shields Avenue exceeds its LOS threshold during the AM peak period. To improve the LOS at this intersection, it is recommended that the following improvements be implemented.
 - DeWolf Avenue and Shields Avenue
 - Modify the southbound left-through-right lane to a left-through lane;
 - Add a southbound right-turn lane; and
 - Modify the intersection to accommodate the added lane.
- At present, all study segments operate at an acceptable LOS.

Existing plus Project Traffic Conditions

- JLB analyzed the location of the proposed access points relative to the existing local roads and driveways in the Project’s vicinity. A review of the Project driveways to be constructed indicates that they are located at points that minimize traffic operational impacts to the existing roadway network.
- At buildout, the proposed Project is estimated to generate a maximum of 1,418 daily trips, 503 AM peak hour trips and 128 PM peak hour trips.
- It is recommended that the Project implement a Class II bike lane along its frontage to Locan Avenue.
- To improve pedestrian safety, it is recommended that a HAWK pedestrian signal and a high visibility crosswalk be installed across Locan Avenue, preferably located on the north side of Cortland Avenue.
- As part of the Project, walkways should be constructed along the Project’s frontage to Locan Avenue. Where possible, walkways should be a minimum of six (6) feet wide and be separated from the street by a park strip to provide some separation between pedestrians and the paved portions of the road.
- It is recommended that the CUSD work with the City of Fresno to implement a Safe Routes to School plan and seek grant funding to help build walkways where they are lacking within a two-mile radius of the proposed Project site.
- Under this scenario, the intersections of Locan Avenue and Shields Avenue and DeWolf Avenue and Shields Avenue are projected to exceed their LOS threshold during the AM peak period. To improve the LOS at these intersections, it is recommended that the following improvements be implemented.
 - Locan Avenue and Shields Avenue
 - Implement an all-way stop control.
 - DeWolf Avenue and Shields Avenue

- Modify the southbound left-through-right lane to a left-through lane;
 - Add a southbound right-turn lane; and
 - Modify the intersection to accommodate the added lane.
- Under this scenario, all study segments are projected to operate at an acceptable LOS.

Near Term plus Project Traffic Conditions

- The total trip generation for the Near Term Projects is 122,993 daily trips, 9,872 AM peak hour trips and 12,041 PM peak hour trips.
- Under this scenario, the intersections of Locan Avenue and Shields Avenue and DeWolf Avenue and Shields Avenue are projected to exceed their LOS threshold during one or both peak periods. To improve the LOS at these intersection, it is recommended that the following improvements be implemented.
 - Locan Avenue and Shields Avenue
 - Add a westbound left-turn lane;
 - Modify the westbound left-through-right lane to a through-right lane;
 - Add a northbound left-turn lane;
 - Modify the northbound left-through-right lane to a through-right lane;
 - Add a southbound left-turn lane;
 - Modify the southbound left-through lane to a through lane;
 - Signalize the intersection with protective left-turn phasing in all directions; and
 - Modify the intersection to accommodate the added lanes.
 - DeWolf Avenue and Shields Avenue
 - Add an eastbound left-turn lane;
 - Modify the eastbound left-through-right lane to a through-right lane;
 - Add a westbound left-turn lane;
 - Modify the westbound left-through-right lane to a through-right lane;
 - Add a northbound left-turn lane;
 - Modify the northbound left-through-right lane to a through-right lane;
 - Add a southbound left-turn lane;
 - Modify the southbound left-through-right lane to a through lane;
 - Add a southbound right-turn lane;
 - Signalize the intersection with protective left-turn phasing in all directions;
 - Implement overlap phasing of the southbound right-turn with the eastbound left-turn; and
 - Modify the intersection to accommodate the added lanes.

- Under this scenario, all study segments are projected to operate at an acceptable LOS.
- Between the Existing Traffic Conditions and the Near Term plus Project Traffic Conditions scenarios, the Project accounts for 1.1 percent of the daily trips, 4.8 percent of the AM peak hour trips and 1.1 percent of the PM peak hour trips of growth in traffic, while the rest can be attributable to the Near Term Projects. Therefore, one can deduce that the majority of the mitigation measures presented under this scenario may not be necessary immediately upon completion of the proposed Project.

Cumulative Year 2035 No Project Traffic Conditions

- Under this scenario, all study intersections are projected to exceed their LOS threshold during one or both peak periods. To improve the LOS at these intersections, it is recommended that the following improvements be implemented.
 - Locan Avenue and Ashlan Avenue (within the jurisdiction of the City of Clovis) is projected to exceed its LOS threshold during the AM peak period. However, this is only projected to last for approximately 15 minutes during the weekday AM peak period due to the short peaking effects of traffic from schools in the area. As a result, the City may want to monitor the operations of this

intersection before it is decided that modifications to the traffic signal will need to be implemented. However, if the City decides to modify the intersection, then it is recommended that the following improvements be considered.

- Modify the westbound through-right lane to a through lane;
- Add a westbound right-turn lane; and
- Modify the traffic signal to accommodate the added lane.
- Temperance Avenue and Shields Avenue
 - Add a second eastbound through lane with a receiving lane east of Temperance Avenue;
 - Add a second northbound through lane with a receiving lane north of Shields Avenue;
 - Open the second southbound left-turn lane; and
 - Modify the traffic signal to accommodate the added lanes.
- Locan Avenue and Shields Avenue
 - Add a westbound left-turn lane;
 - Modify the westbound left-through-right lane to a through-right lane;
 - Add a northbound left-turn lane;
 - Modify the northbound left-through-right lane to a through-right lane;
 - Add a southbound left-turn lane;
 - Modify the southbound left-through lane to a through lane;
 - Signalize the intersection with protective left-turn phasing in all directions;
 - Implement overlap phasing of the southbound right-turn with the eastbound left-turn; and
 - Modify the intersection to accommodate the added lanes.
- DeWolf Avenue and Shields Avenue
 - Add an eastbound left-turn lane;
 - Modify the eastbound left-through-right lane to a through-right lane;
 - Add a westbound left-turn lane;
 - Modify the westbound left-through-right lane to a through-right lane;
 - Add a northbound left-turn lane;
 - Modify the northbound left-through-right lane to a through lane;
 - Add a northbound right-turn lane;
 - Add a southbound left-turn lane;
 - Modify the southbound left-through-right lane to a through lane;
 - Add a southbound right-turn lane;
 - Signalize the intersection with protective left-turn phasing in all directions;
 - Implement overlap phasing of the southbound right-turn with the eastbound left-turn; and
 - Modify the intersection to accommodate the added lanes.
- Under this scenario, the segment of Shields Avenue between Temperance Avenue and Locan Avenue is projected to operate at an unacceptable LOS. To improve the LOS of this segment, it is recommended that Shields Avenue be modified to accommodate two lanes in each direction.

Cumulative Year 2035 plus Project Traffic Conditions

- Under this scenario, all study intersections are projected to exceed their LOS threshold during one or both peak periods. To improve the LOS at these intersection, it is recommended that the following improvements be implemented.
 - Locan Avenue and Ashlan Avenue (within the jurisdiction of the City of Clovis) is projected to exceed its LOS threshold during the AM peak period. However, this is projected to last for approximately 15 minutes during the weekday AM peak period due to the short peaking effects of traffic from schools in the area. As a result, the City may want to monitor the operations of this

intersection before it is decided that modifications to the traffic signal will need to be implemented. However, if the City decides to modify the intersection, then it is recommended that the following improvements be considered.

- Modify the eastbound through-right lane to a through lane;
- Add an eastbound right-turn lane;
- Modify the westbound through-right lane to a through lane;
- Add a westbound right-turn lane; and
- Modify the traffic signal to accommodate the added lanes.
- Temperance Avenue and Shields Avenue
 - Add a second eastbound through lane with a receiving lane east of Temperance Avenue;
 - Add a second northbound through lane with a receiving lane north of Shields Avenue;
 - Open the second southbound left-turn lane; and
 - Modify the traffic signal to accommodate the added lanes.
- Locan Avenue and Shields Avenue
 - Add a westbound left-turn lane;
 - Modify the westbound left-through-right lane to a through lane;
 - Add a westbound right-turn lane;
 - Add a northbound left-turn lane;
 - Modify the northbound left-through-right lane to a through-right lane;
 - Add a southbound left-turn lane;
 - Modify the southbound left-through lane to a through lane;
 - Signalize the intersection with protective left-turn phasing in all directions;
 - Implement overlap phasing of the southbound right-turn with the eastbound left-turn; and
 - Modify the intersection to accommodate the added lanes.
- DeWolf Avenue and Shields Avenue
 - Add an eastbound left-turn lane;
 - Modify the eastbound left-through-right lane to a through-right lane;
 - Add a westbound left-turn lane;
 - Modify the westbound left-through-right lane to a through-right lane;
 - Add a northbound left-turn lane;
 - Modify the northbound left-through-right lane to a through lane;
 - Add a northbound right-turn lane;
 - Add a southbound left-turn lane;
 - Modify the southbound left-through-right lane to a through lane;
 - Add a southbound right-turn lane;
 - Signalize the intersection with protective left-turn phasing in all directions;
 - Implement overlap phasing of the southbound right-turn with the eastbound left-turn; and
 - Modify the intersection to accommodate the added lanes.
- Under this scenario, the segment of Shields Avenue between Temperance Avenue and Locan Avenue is projected to operate at an unacceptable LOS. To improve the LOS of this segment, it is recommended that Shields Avenue be modified to accommodate two lanes in each direction.

Project's Pro-Rata Fair Share of Future Transportation Improvements

The Project's fair share percentage impact to study intersections projected to fall below their LOS threshold and which are not covered by an existing impact fee program is provided in Table E-17-3. The Project's fair share percentage impacts were calculated pursuant to the Caltrans Guide for the Preparation of Traffic Impact Studies. The Project's pro-rata fair shares were calculated utilizing the Existing volumes, Project Only Trips and Cumulative Year 2035 plus Project volumes. JLB 2018, Figure 2 illustrates the Existing traffic

volumes, JLB 2018, Figure 4 illustrates the Project Only Trips, and JLB 2018, Figure 9 illustrates the Cumulative Year 2035 plus Project traffic volumes. Since the critical peak period for the study facilities was determined to be during the AM peak, the AM peak volumes are utilized to determine the Project’s pro-rata fair share.

It is recommended that the Project contribute its equitable fair share as listed in Table E-17-3 for the future improvements necessary to maintain an acceptable LOS. However, fair share contributions should only be made for those facilities or portion thereof currently not funded by the responsible agencies roadway impact fee program(s), as appropriate. For those improvements not presently covered by local and regional roadway impact fee programs, it is recommended that the Project contribute its equitable fair share. Payment of the Project’s equitable fair share in addition to the local and regional impact fee programs would satisfy the Project’s traffic mitigation measures.

This study does not provide construction costs for the recommended mitigation measures; therefore, if the recommended mitigation measures are implemented, it is recommended that the District work with the City of Fresno to develop the estimated construction cost.

TABLE E-17-3

Project’s Fair Share of Future Roadway Improvements

<i>ID</i>	<i>Intersection</i>	<i>Existing Traffic Volumes (AM Peak)</i>	<i>Cumulative Year 2035 plus Project Traffic Volumes (AM Peak)</i>	<i>Project Only Trips (AM Peak)</i>	<i>Project's Fair Share (%)</i>
1	Locan Avenue / Ashlan Avenue	2,204	4,059	162	8.73%
2	Temperance Avenue / Shields Avenue	2,147	5,258	98	3.15%
3	Locan Avenue / Shields Avenue	1,067	2,564	152	10.15%
4	DeWolf Avenue / Shields Avenue	1,152	2,105	37	3.88%
<i>ID</i>	<i>Shields Avenue between:</i>	<i>Existing Traffic Volumes (Daily)</i>	<i>Cumulative Year 2035 plus Project Traffic Volumes (Daily)</i>	<i>Project Only Trips (Daily)</i>	<i>Project's Fair Share (%)</i>
2	Temperance Avenue and Locan Avenue	6,549	21,660	1,100	7.28%

Note: Project Fair Share = ((Project Only Trips) / (Cumulative Year 2035 + Project Traffic Volumes - Existing Traffic Volumes)) x 100

(This area intentionally left blank)

Note: * = Does not exist or is not projected to exist

Mitigation Measures:

Mitigation Measure T-1: The District shall contribute its proportionate fair share for traffic improvements for those facilities or portions thereof not currently funded by the responsible agencies roadway impact fee program(s), as appropriate. The District's proportionate fair share is as indicated in Table E-17-3.

Mitigation Measure T-2: The District shall participate in a pro rata basis in the provision of adequate turn lane storage capacity as indicated in Table E-17-4.

Mitigation Measure T-3: The District shall install a Class II bike lane along its Locan Avenue frontage.

Mitigation Measure T-4: To improve pedestrian safety, a HAWK pedestrian signal and a high visibility crosswalk shall be installed across Locan Avenue, preferably located on the north side of Cortland Avenue.

Mitigation Measure T-5: As part of the Project, walkways shall be constructed along the Project's frontage to Locan Avenue. Where possible, walkways shall be a minimum of six (6) feet wide and be separated from the street by a park strip or barrier curb to provide some separation between pedestrians and the paved portions of the road.

Mitigation Measure T-6: The District shall work with the City to identify funding sources (such as submitting a grant application for Active Transportation Program (ATP)) to complete the Safe Routes to School paths.

- b. Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?**

Less than Significant

Fresno Council of Governments (FCOG) is the Congestion Management Agency for Fresno County. FCOG's Congestion Management Process (CMP) focuses on "Regionally Significant Roads". Little congestion exists in Fresno County, especially outside the Fresno/Clovis metropolitan area (FCOG 2009). The proposed school site is not located on a Regionally Significant Road.

- c. Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?**

No Impact

The proposed school site is not within two nautical miles of an existing or proposed public or private airport and is not within an Airport Influence Area (AIA). The proposed school would have no design or operational characteristics that would result in an increase in air traffic levels or a change in location.

- d. Would the project substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?**

Less than Significant

Any new and upgraded roadways will be designed according to applicable state and local design standards. The preliminary site plan involves the construction of two new roads along south and east sides of the site, each of which will have two access points. The design features of this project will comply with all City of Fresno policies.

- e. Would the project result in inadequate emergency access?**

Less than Significant

Clovis Unified will work with the City to ensure adequate emergency access to the proposed project and follow objectives and policies of the Fresno General Plan that will support implementation and provide adequate emergency access. In addition, as mentioned in Impact E, 17, d, the roadways associated with the project will be designed according to applicable governmental agency design standards. Emergency access may be hindered during periods of construction, but alternative routes would be available.

- f. **Would the project conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?**

Less than Significant

The District will provide busing services to all students that reside beyond 1 mile for K through 6th grade. Most of the existing and planned residential development within the school's attendance area is within the no bussing zone. As a result, most of the students will likely need to walk, bike, or be driven to school. Applicable plans include City of Fresno's General Plan and Active Transportation Plan. The Project supports the goals of these plans by enhancing the bicycle and pedestrian networks. The Project will include walkways and Class II bike lanes along Locan Avenue, and a HAWK pedestrian signal across Locan Avenue. The District will work with the City to identify funding sources to complete Safe Routes to School paths and encourage the City to condition all new residential development proposals within a one-mile radius to conduct a Safe Routes to School evaluation from the project to the school site and require them to work on eliminating any barriers to the Safe Routes to School.

18. Tribal Cultural Resources

- a. **Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:**
- **Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or**
 - **A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.**

Less than Significant with Mitigation

The District has not received any formal requests for tribal consultation under AB 52. All tribes on the Native American Heritage Commission (NAHC) list for this location were notified of the project by a Request for Preliminary Comment (RFC) that was mailed to them. One comment letter was received in which the tribe declined participation at this time. The District has no information or evidence that Tribal Cultural Resources exist in relation to the site or will be affected by the project. However, it is possible that subsurface resources could exist and be disturbed by project construction activities. Therefore, the following mitigation measure has been incorporated into the project:

Mitigation Measure TC-1: If subsurface tribal cultural resources are discovered during excavation and/or construction activities, construction shall stop in the immediate vicinity of the find and a qualified tribal cultural resources professional shall be consulted to determine whether the resources require further study. If the resources are determined to be significant, mitigation measures shall be identified by the cultural resources professional and recommended to the District. If human remains are discovered, the procedures of Mitigation Measure CR-2 shall also apply.

19. Utilities and Service Systems

- a. **Water and Wastewater**

Would the project:

- **Require or result in relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?**

- **Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?**
- **Result in a determination by the wastewater treatment provider that serves or may serve the project that it has adequate capacity to serve the project’s projected demand in addition to the provider’s existing commitments?**

Less than Significant

Although the project will not be annexed at this time, water and wastewater services will be provided by the City through an extraterritorial agreement (Appendix B). The District would comply with the City of Fresno Municipal Code and Standard Construction requirements for sewer and water connections, extensions, fees, permits, and related matters.

Water

Table E-19-1 on the following page shows the estimated water use from the general plan designated land use for the site. Table E-19-2 shows the actual metered volumes taken from nearby comparable schools within the District. The tables indicate that estimated water use for the proposed project, at approximately 35 acre-feet per year, will be significantly less than the 250.0 acre-feet per year for development in accordance with the current Fresno General Plan land use designations.

The extraterritorial service agreement with the City of Fresno provides that the water supply necessary for the project will be provided by the District either through assignment of water entitlements associated with the property, the acquisition of additional surface water rights or the payment of a fee per acre-foot of water needed for the project to the City of Fresno.

Wastewater

Table E-19-3 on the following page compares the estimated wastewater generation of the proposed project with the estimated wastewater generation from the general plan designated land use for the site. This is derived by taking the domestic (indoor) portion of the estimated water use, approximately 1.7 acre-feet per year, converting it to gallons per day (gpd) and reducing it by a factor of 20 percent. Table E-19-3 indicates that the proposed project, at an estimated 1,214 gallons per day, will generate significantly less wastewater than the 71,914 gallons per day generated by development in accordance with the current Fresno General Plan land use designation.

The Fresno-Clovis Regional Wastewater Reclamation Facility operates in compliance with applicable requirements of the Regional Water Quality Control Board. Although the project would contribute to the cumulative impact described in the Fresno General Plan EIR, the cumulative impacts of full buildout were found to be less than significant with mitigation.

Stormwater

The site is within the Fresno Metropolitan Flood Control District (FMFCD) Drainage Area “DS”. Although permanent drainage service is currently not available in Drainage Area “DS”, FMFCD’s future Master Plan drainage system will have the capacity to serve the project as indicated in FMFCD’s letter to Clovis Unified dated March 21, 2018, and incorporated by reference in this Initial Study. The District will enter into an agreement with FMFCD that will include Items 2a through 2d in FMFCD’s letter to facilitate the provision of permanent drainage service. Based on the above, the project’s impacts related to storm drainage are less than significant.

Power and Telecommunications

The project site is located immediately adjacent to existing urban development in the City of Fresno. The District’s administration and consultants have received no indication that the project would have any potentially significant impacts related to power and communications.

TABLE E-19-1
Estimated Water Use – Planned Land Use

	Acres	Land Use	Use Type	Units	af/du/yr	af/yr
GP Land Use	25	Residential Urban Neighborhood (20 du/ac)	Domestic	500	0.2	100.0
			Irrigation	500	0.3	150.0
Total						250.0

Source: Odell Planning & Research, Inc. 2018; Tully & Young. *Land Use/Water Supply Guidebook*. 2007

TABLE E-19-2
Estimated Water Use – Existing Comparable Schools

	Land Use	Use Type	af/yr
Oraze Elementary (2012-2017 average)	Elementary School	Domestic Use	1.7
		Irrigation Use	32.0
Total			33.7
Boris Elementary (2017)	Elementary School	Domestic Use	1.1
		Irrigation Use	33.6
Total			34.7
Estimated Total for Project			35.0

e. Would the project:

- **Generate solid waste in excess of State or local standards or in excess of the capacity of local infrastructure?**
- **Negatively impact the provision of solid waste services or impair the attainment of solid waste reduction goals?**
- **Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?**

Less than Significant

The District contracts for solid waste services with Industrial Waste and Salvage (IWS). IWS uses a materials recovery facility, the Cedar Avenue Recycling and Transfer Station (CARTS), to divert recyclable material before transporting the remaining material to the Fairmead Landfill in Madera County. The Fairmead Landfill has a life expectancy of 26 years under current practices with an estimated closure date in 2044. The General Plan EIR states that buildout of the general plan will have a less than significant impact on solid

waste disposal needs. The District operates its existing schools and would operate the proposed project in compliance with applicable statutes and regulation related to solid waste.

20. Wildfire

- a. **If located in or near state responsibility areas or land classified as very high fire hazard severity zones, would the project:**
- **Impair an adopted emergency response plan or emergency evacuation plan?**
 - **Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?**
 - **Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?**
 - **Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?**

No Impact

The project site is not in or near a state responsibility area or a very high fire hazard severity zone.

21. Mandatory Findings of Significance

- a. **Does the proposed school project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?**

Less than Significant with Mitigation

Based on the information in Sections E, 4 and E, 5, the project could have potentially significant effects on biological and cultural resources, but these effects would be less than significant with the incorporation of the mitigation measures provided.

- b. **Does the project have impacts that are individually limited, but cumulatively considerable? (“Cumulatively considerable” means the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)**

Less than Significant

Based on the information in Sections E, 1 – E, 20, the proposed project would not have any impacts that would be individually limited but cumulatively considerable.

- c. **Does the project have environmental effects, which will cause substantial adverse effects on human beings, either directly or indirectly?**

Less than Significant with Mitigation

Based on the information in Sections E, 3 and E, 13, the proposed school project could potentially have substantial adverse effects on human beings with respect to air quality and noise. However, mitigation measures have been incorporated in the project that would reduce the impacts to insignificance.

F. Mitigation Monitoring and Reporting Program

1. Purpose

The District has prepared this Mitigation Monitoring and Reporting Program to comply with Section 15097 of the State CEQA Guidelines. The purpose for the Mitigation Monitoring and Reporting Program is to ensure implementation of the mitigation measures identified in this Initial Study.

2. Lead Agency

Clovis Unified School District will undertake the project and is the Lead Agency for the project. The District is responsible for the implementation of all mitigation measures identified in this Initial Study.

3. Mitigation Monitoring and Reporting Coordinator

The Assistant Superintendent, Facility Services, or his/her designee shall act as the Project Mitigation Monitoring and Reporting Coordinator ("Coordinator").

4. Monitoring and Reporting Procedures for Design-, Site Clearing-, and Construction Mitigation Measures

- a. The Coordinator shall provide a copy of all project design-, site clearing- and construction-related mitigation measures to the project engineer and contractor for incorporation in the project plans, construction specifications, permits, and contracts, as appropriate.
- b. Prior to award of bid, the Coordinator shall determine that all project design-, site clearing- and construction-related mitigation measures have been incorporated in the project plans, construction specifications, permits, and contracts, as appropriate.
- c. During construction, the Coordinator, through the construction management team, shall inspect the project area regularly to ensure all work complies with the mitigation measures. If a discrepancy is not resolved within a reasonable time, the Coordinator may order work to cease until the discrepancy is resolved.
- d. Prior to the District accepting the project improvements, the Coordinator shall certify that the project incorporates all project design and construction-related mitigation measures.

5. Monitoring and Reporting Procedures for Operational- and Maintenance-Related Mitigation Measures

Before the project becomes operational, the Coordinator shall determine that the project operational plans and procedures incorporate all operations-related mitigation measures.

G. Names of Persons Who Prepared or Participated in the Initial Study

1. Lead Agency

Clovis Unified School District

Kevin Peterson, Assistant Superintendent, Facility Services
1450 Herndon Avenue, Clovis, CA 93611
(559) 327-9260
kevinpeterson@cusd.com

2. Environmental Consultants:

Odell Planning & Research, Inc.

49346 Road 426, Suite 2
Oakhurst, CA 93644
Telephone: (559) 472-7167
